MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIII. COLUMBIA, MO., JANUARY, 1919. No. 1

GENERAL SUMMARY.

Except the first week, which was cold and moist, January, 1919, was characterized by mild, open weather, an abundance of sunshine and a marked deficiency in precipitation. It was the driest January since the beginning of precipitation records in this State, about 52 years ago. Altogether it was a favorable month for outdoor pursuits, and a remarkably pleasant one from the side of personal comfort.

The soil was in excellent condition, and considerable plowing was done the latter half of the month. The wheat crop was rated as good to excellent. Stock were in fine condition, the well grown wheat and rye fields furnishing excellent pasturage. Public roads were never in better condition this time of the year, and traffic was heavy. Because of the unusually mild weather rural ice houses are empty.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 34 0°. The mean departure from the normal for 65 stations having 10 or more years' record was plus 3.6°. The present month was about 18° warmer than the same month in 1918, though it is probably well to mention the fact that January, 1918, was the coldest on record. The present month opened decidedly cold, and on the 3d and 4th zero conditions prevailed everywhere, save in the extreme Southeast. By the 8th or 10th, however, the weather had become much milder, and the remainder of the month was remarkable for its fine, spring-like weather.

PRECIPITATION.

The average monthly precipitation, 83 stations reporting, was 0.40 inch. The departure from the normal for 75 stations having 10 or more years' record was minus 1.88 inches. This has been the driest January in 52 years, although a few other Januarys have been nearly as dry, namely, 1872, 1875, 1881, and 1893. Eight stations received no precipitation at all; seven others had a trace only, and about 34 received a total fall of 0.10 inch or less. The snowfall was unusually light. All of it fell during the cold spell of the first week; by the 13th all snow had disappeared from the ground, even in the most northerly counties.

WIND.

The prevailing winds were from the southwest. The average hourly velocity, 8 stations equipped with anemometers reporting, was 8.7 miles, varying but little from normal. There were no high winds during the month.

SUNSHINE AND CLOUDINESS.

The number of hours of sunshine was 256. This is about 73 per cent of the possible and 22 per cent greater than normal. The number of clear days in this January exceed all previous records for this month.

MISCELLANEOUS PHENOMENA.

Aurora—At Springfield on 22d.

Fogs, dense—19th, 20th, 22d, 23d, and 27th.

Halos, solar—4th, and 13th. Lunar—11th, 13th, 15th, and 16th.

Sleet—1st, and 16th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for January, 1919.

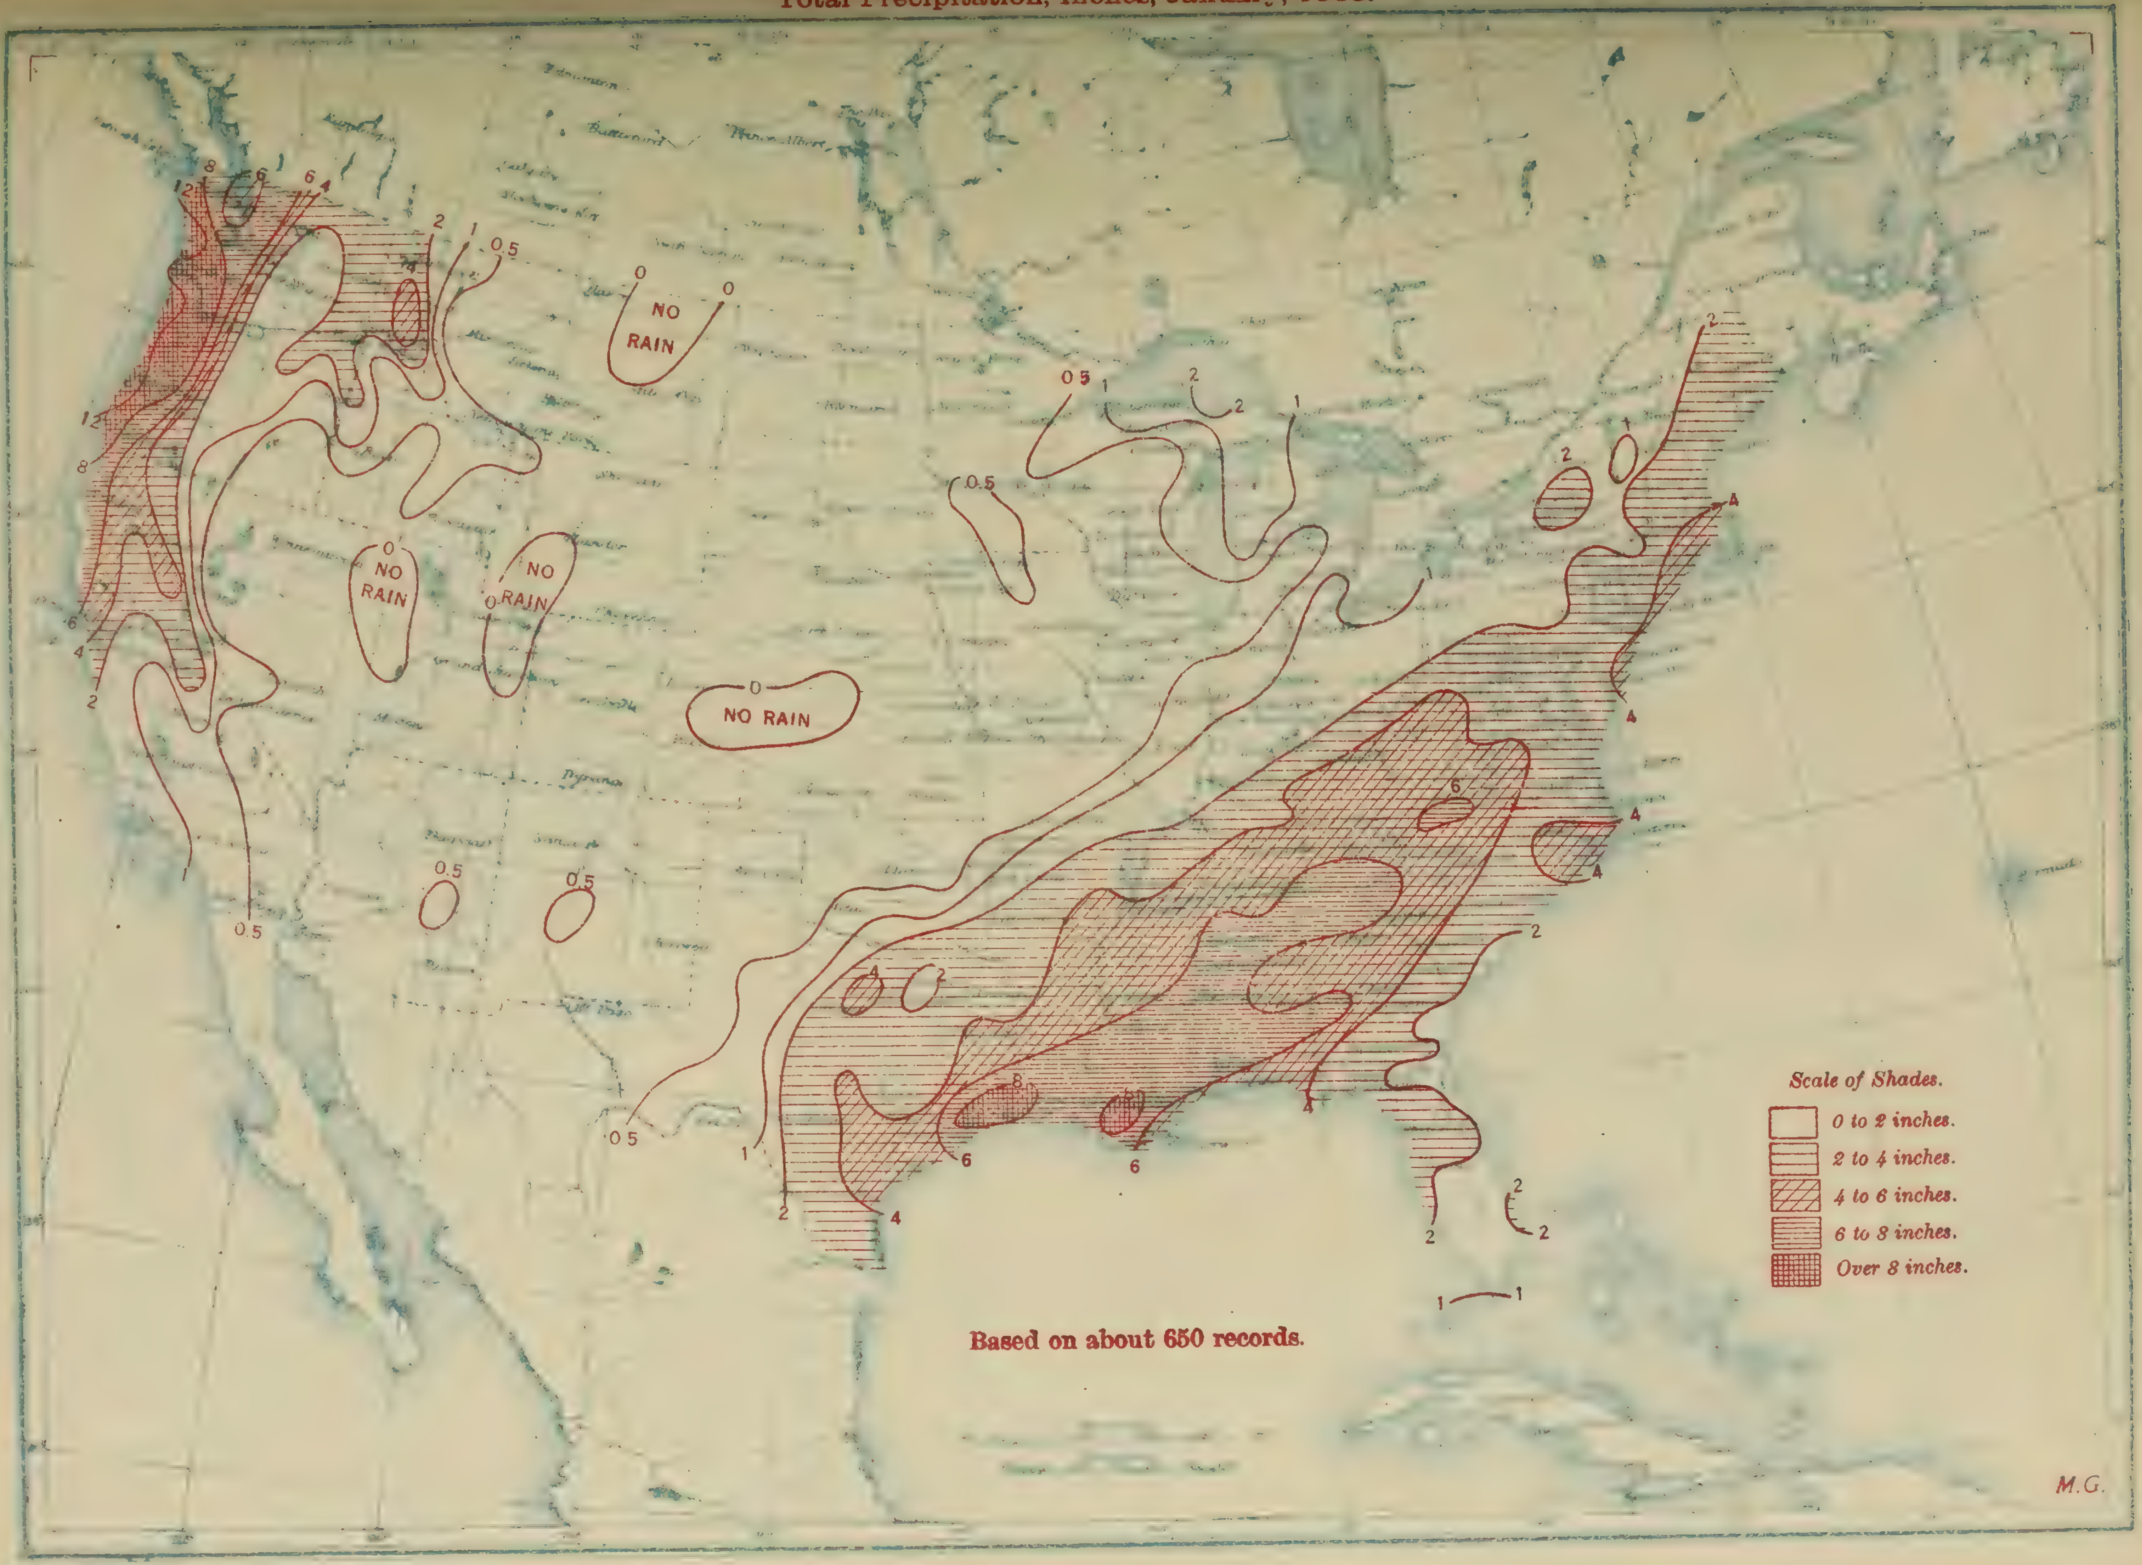
a, b, c, etc., indicate respectively 1, 2, 3, etc., days missing from the record. §§ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

Total Precipitation, Inches, January, 1919.



OBSERVERS' REMARKS.

Avalon—A remarkably fine month; no frost in the ground to hinder plowing of sod.

Grant City—January was favorable for all kinds of work; some plowing has been done. Wheat prospects good.

Kidder—The first ten days were very cold; the remainder of the month was continuous mild weather.

Brunswick—Mild temperatures prevailed. I picked blooming sweet violets, entirely unprotected, on January 30.

Fayette—Warmest January observed on local records, also very dry. Exceptionally fine weather most of the month.

Gorin—The first week was cold; but the remainder of the month was mild; no precipitation.

Kirksville—A remarkably fine month; averaged about 16° warmer than January, 1918; last 22 days temperature ranged from 38° to 59°. No precipitation.

Louisiana—Flies buzzing around 23d, 24th, and 25th.

Oakfield—This has been the driest month since the beginning of observations in June, 1892.

St. Catherine—The first five days of January average 1.5° colder than any consecutive five days of which there is a record here. The remainder of the month has been fine.

Warrenton—After the cold snap during the first week, the weather has been mild and springlike.

Jackson—The finest January in 40 years.

Farmington—This month has been remarkable for its uniform and mild temperatures; after the first six days the daily range was small; up to the last day the prevailing winds were from the northwest to the southwest.

Gano—This has been the mildest and driest January for many years; no rain and very little snow. Wheat looking fine.

Houston—This has been an exceptionally fine January, the mildest in many years. After the 6th we had continuous fine weather; especially favorable for stock.

Koshkonong—Remarkably fine weather for January.

Lockwood—This has been a beautiful winter month; the moisture was ample, although we had a large amount of sunshine. Wheat in good condition.

Rolla—Probably a record breaker for warm and fair January.

Appleton City—Least rainfall for January in several years; mild, open, and springlike. Roads fine but getting dusty.

Lamonte—A very unusually mild month. Some little plowing done the latter part. Wheat looks very good.

Warrensburg—January was unusual for large number of clear days and prevailing mild temperature.

Warsaw—After the 5th, the month was remarkably fine for farmers and feeders.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., February, 1919. No. 2

GENERAL SUMMARY.

Like the preceding two months February in Missouri was quite mild most of the time. There were no severe temperature changes, and the moisture and sunshine were sufficient for present needs. February concluded the fifth consecutive month with positive temperature departures, though November was but slightly above normal. The winter of 1918-1919, for the State as a whole, ranks as one of the mildest, if not the mildest, in thirty years.

During the first ten days the soil was in such good condition that considerable plowing was done. At the close of the month wheat was in good to excellent shape. Stock was in good condition.

Somewhat cold, snowy and blustry weather on the 8th, 9th, and 28th slightly interrupted general traffic. Owing to the prevailing mild conditions no ice was harvested during the month, or during the winter.

TEMPERATURE.

The monthly mean temperature, 65 stations reporting, was 35.3°. The departure from the normal for 62 stations having 10 or more years' record was plus 4.0°. The temperature excess was quite marked in all divisions, but the southwestern and northeast plains, and northwestern plateau averaged about 2° warmer than the Ozark Plateau and southeastern lowlands. The 1st, 11th, and 12th were the warmest days, with maximum temperatures of 65° or higher north of the Ozarks, and 68° to 71° in the southern border counties. The 9th, 10th, and 28th were the coldest days, zero temperatures being more or less general, save in the southeastern lowlands. The minimum was −10°, at Neosho. Minimum temperatures were 32° or lower on 23 days; but there were only 6 typical winter days, i. e., days on which the maximum temperature did not rise above 32°.

PRECIPITATION.

The average precipitation, 82 stations reporting, was 1.98. The mean departure from the normal for 73 stations having 10 or more years' record was minus 0.35 inch. The western half of the State received normal or above normal precipitation, while the eastern half got less than normal, the most marked deficiency occurring in the southeastern lowlands where the total fall was 1.87 less than the usual February precipitation. There was not much precipitation during the first ten days. The greatest monthly amount, 3.70 inches, occurred at Warsaw, and the least, 1.02 inches, at Mexico. The greatest amount for any 24 consecutive hours was 2.20 inches, at Tarkio.

The average snowfall was 6.4 inches. This is slightly less than normal. Snows were more or less general on the 14th, 15th, 20th, and 28th. The greatest monthly fall was 17 inches, at Lebanon, Laclede County.

WIND.

The prevailing winds were from the northwest. The month was rather windy; the average hourly velocity, as recorded at 8 well distributed stations equipped with anemometers, was 11.7 miles, or about 10 per cent greater than normal. Fresh to strong winds, 39 to 50 miles per hour, occurred on the 12th, 14th, 25th, and 28th.

SUNSHINE AND CLOUDINESS.

The brightness of the month differed but little from the normal. The number of hours of sunshine, based upon records of 5 well selected stations, was 170. This is about 56 per cent of the possible and about 5 per cent above the normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense—11th, and 20th. Halos, solar—8th, 10th, 12th, 24th, 25th, 27th, and 28th. Lunar—4th, 6th, 10th, and 11th. Sleet—7th, 14th, 19th, 20th, 24th, 25th, 27th, and 28th. Thunderstorms (thunder heard) on the 3d, at Kansas City and St. Joseph.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for February, 1919.

CLIMATOLOGICAL DATA

MISSOURI SECTION

IN COOPERATION WITH THE UNIVERSITY OF MISSOURI

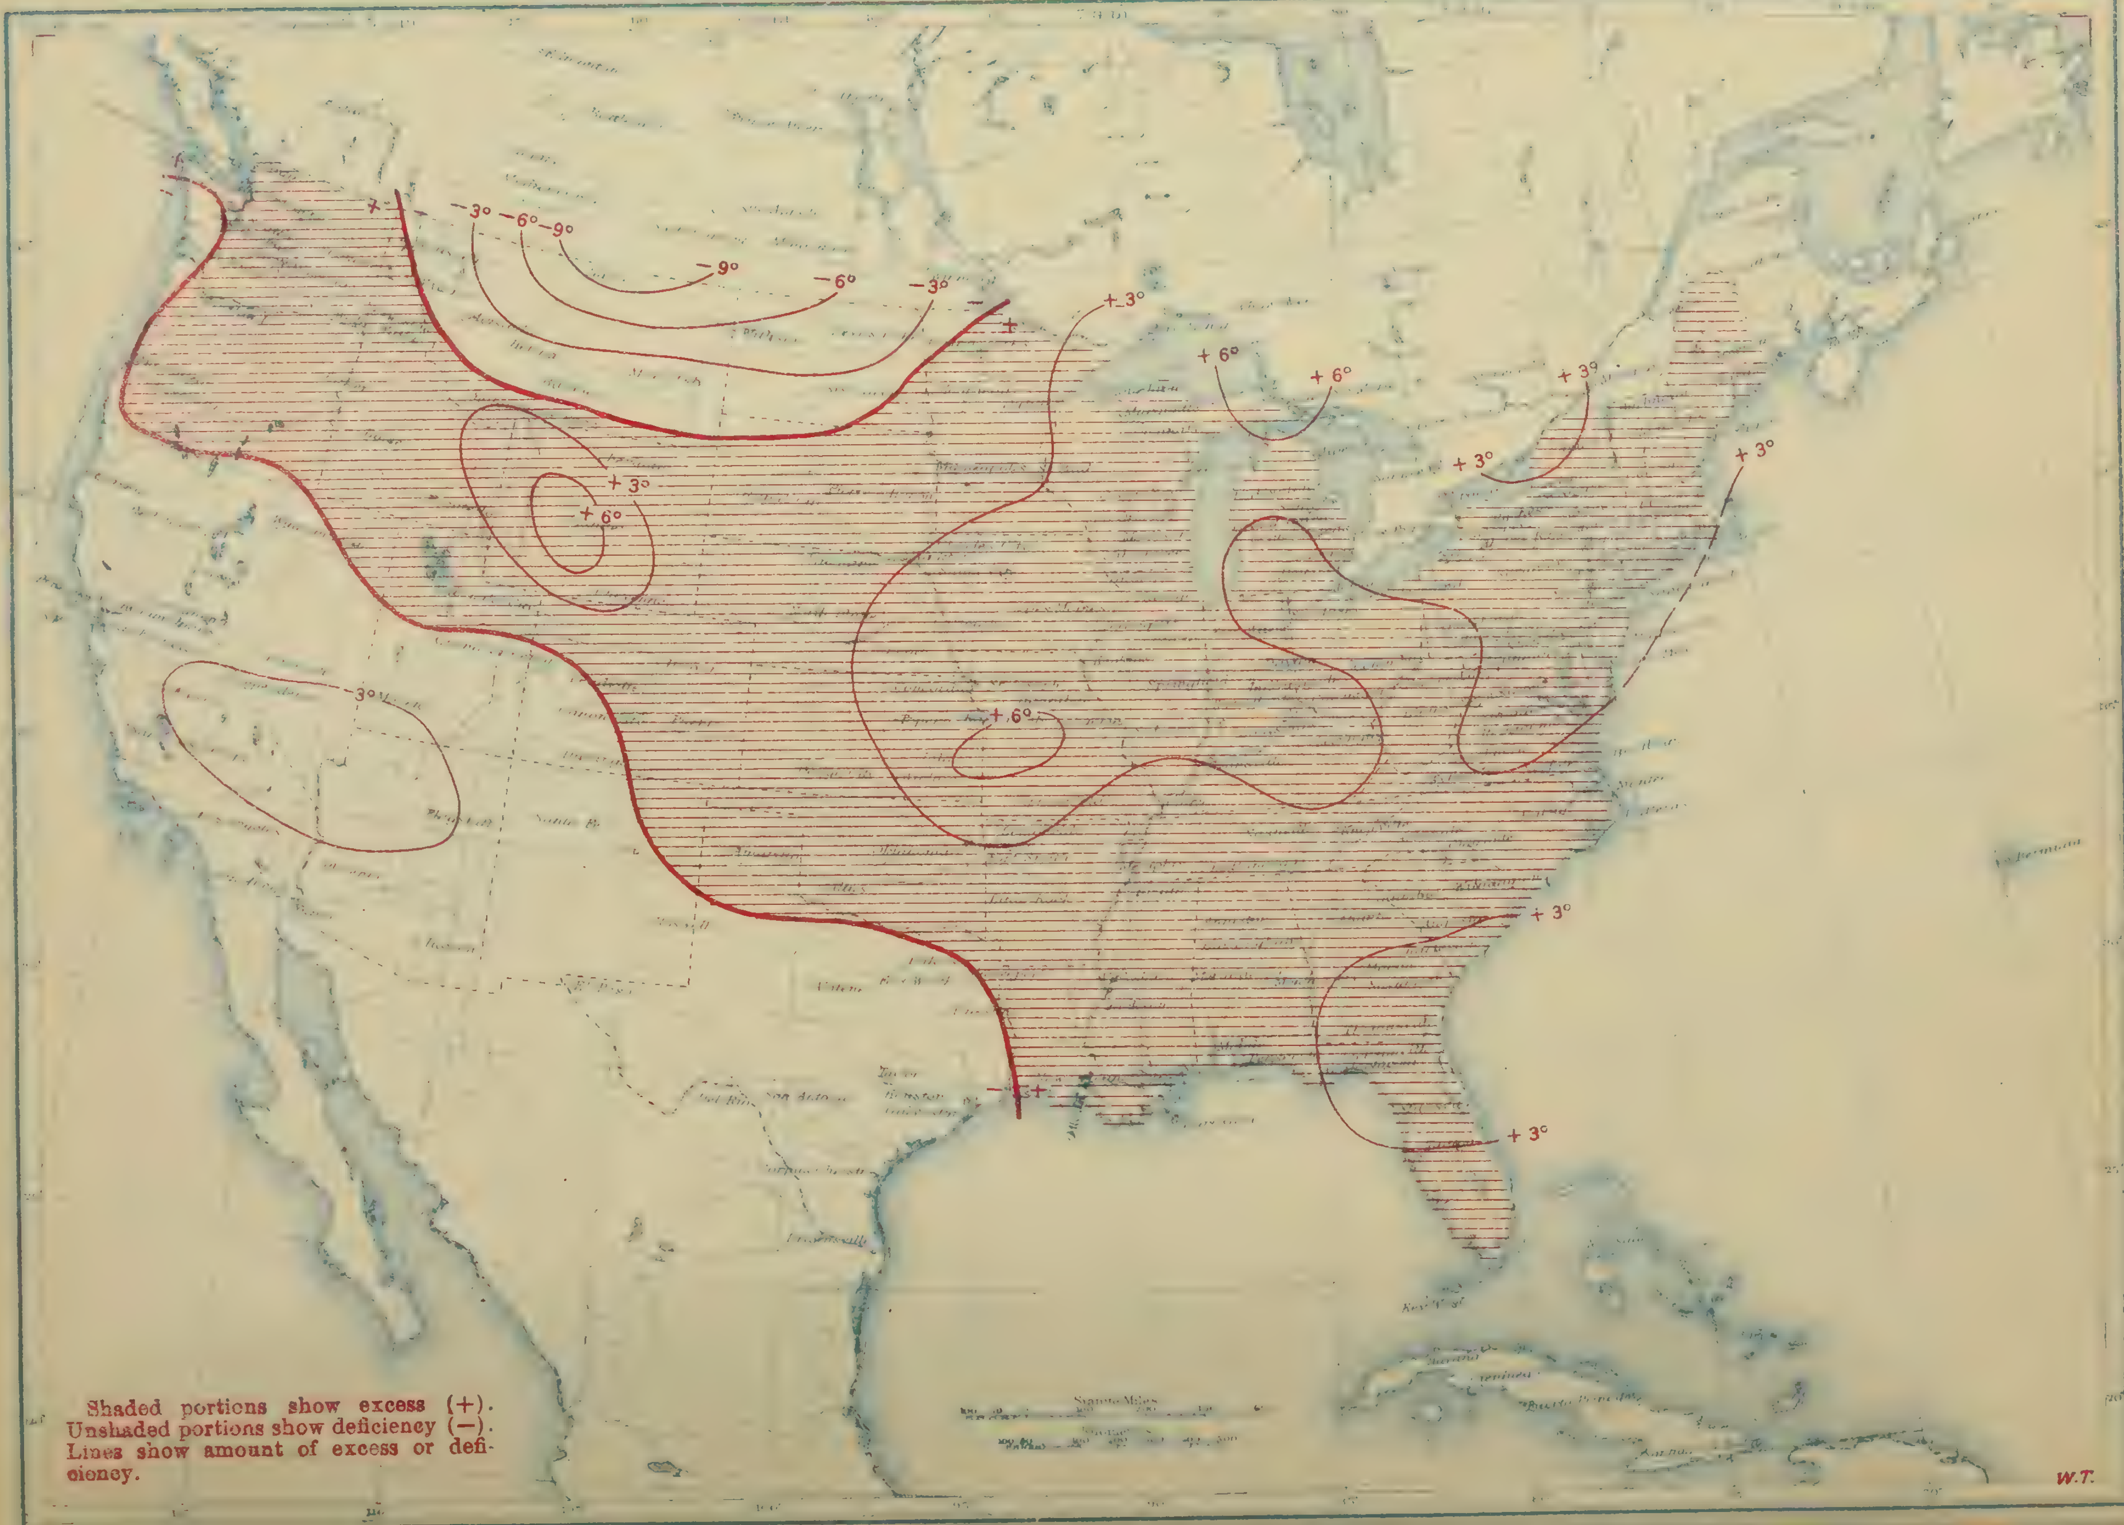
MARCH, 1919

BY

GEORGE REEDER
METEOROLOGIST

COLUMBIA, MO.,
WEATHER BUREAU OFFICE
APRIL 25, 1919.

Departure of the Mean Temperature from the Normal, March, 1919.



Shaded portions show excess (+).
Unshaded portions show deficiency (−).
Lines show amount of excess or deficiency.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., March, 1919. No. 3

GENERAL SUMMARY.

March, 1919, in Missouri, was, as a rule, mild in all sections, and generally favorable for outdoor pursuits. The month was unusually free from that blustry weather commonly associated with March, though there were a few local storms. There was some local flood damage in the lowlands of the Grand, Platte, and Nodaway rivers, caused principally by waters coming from the upper watersheds.

At the close of the month the wheat crop was in excellent condition. Oats were nearly all seeded: and pastures and meadows had started growth. The fruit prospect was fair to good.

TEMPERATURE.

The monthly mean temperature, based upon reports of 66 stations, was 46.3. The mean departure from normal for 64 stations having 10 or more years' record was plus 2.9°. Except two or three days during the first decade and three in the last decade the daily mean was above the normal. The 1st was the coldest day, with two stations reporting —2° as a minimum temperature. The warmest period was from about the 10th to the 20th, when the daily temperature excess ranged from 1° to 27°. The day temperatures reached 70° or higher on the 15th, 19th, 20th, and 29th. The average number of days with temperature 32° or lower was 14.

PRECIPITATION.

The average precipitation, 82 stations reporting, was 2.40 inches. The departure from the normal for 74 stations having 10 or more years' record was minus 0.69 inch. The monthly precipitation was in the form of light to moderate showers. On the 5th, 6th, and 8th to 10th they were rather local; from the 14th to the 17th they were moderate to heavy and general; and again on the 25th, and 26th. Geographically the total monthly amounts varied quite markedly. Twelve stations, all in the northwestern plateau and southeastern lowlands, received amounts in excess of the normal, while 54 stations got less than normal. The moisture was sufficient for present needs, probably a little too much locally in the two named sections. The greatest local monthly amount, 8.67 inches, fell at Caruthersville, and the least, 0.37 inch, at Amoret. The greatest amount in any 24 consecutive hours was 5.37 inches, at St. Joseph on the 15-16th.

A moderate snowstorm prevailed on the 7th, and 8th. The total fall was of little consequence, save in the Ozarks where amounts ranged between 3 and 11 inches; it soon melted, however.

EVAPORATION.

The weather did not permit of evaporation observations until about the 7th. The total evaporation for 25 days, at Columbia, Mo., was 2.187 inches; the total rainfall, 1.12 inches; the total wind movement over the surface of the pan, 1,316 miles, and the mean temperature, 49.2. During the same month in 1918 (full month), these data were in order named: 3.693 inches; 0.64 inch; 1,728 miles, and 50.9°. See page 24 for daily data.

WIND.

The prevailing winds were from the south. The average wind movement, 8 stations equipped with anemometers reporting, was 7,790 miles, or about 4 per below normal. Brisk to strong winds obtained on the 8th, 15th, and 16th. For more detailed report see page 24.

SUNSHINE AND CLOUDINESS.

There were 15 clear, 8 partly cloudy, and 8 cloudy days. The average number of hours of sunshine, six well selected stations reporting, was 236, 64 per cent of the possible, and 9 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fog—9th, 17th, 22d, and 26th. Hail—15th. Lunar halos—9th, and 12th. Solar—1st, 2d, 6th, 8th, 12th, 13th, 23d, 24th, 28th, and 29th. Sleet—4th, and 8th. Thunderstorms—14th, 15th, 16th, 25th, and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for March, 1919.

*Frozen.

Observations taken at 6.45 a. m.

OBSERVERS' REMARKS.

Houston—March has been a fine month for farm work. Wheat is looking fine; oat sowing is over. Peach trees are in full bloom.

Lebanon—The weather has been excellent for the peach crop. The peach crop is safe so far.

Lockwood—The month has been cool. The ground in this locality is rather wet and cold and farm work is backward. Oats just about all seeded. Sunshine needed.

Brunswick—The sandy bottoms between here and Chillicothe absorbed much surplus water that fell farther north.

Fayette—Rather unusual occurrence on the 20th when at about 4 p. m. the temperature dropped 8° in two or three minutes.

Kirksville—Meteorogically an uneventful month.

Louisiana—There were heavy frosts on the 27th, and 28th.

St. Catherine—Grass and wheat look as green as they usually do the latter part of April.

Bethany—On the morning of the 16th creeks and rivers were out in the bottoms.

Grant City—Unfavorable for farm work but good for all grasses. Wheat condition excellent; pastures starting good; very few oats sown but the work is progressing now.

Lexington—Ideal month in every respect. Sufficient moisture, and an abundance of sunshine.

Amoret—The oats crop was all seeded during this month. Excellent weather for farm operations.

Appleton City—The weather has been fine for outdoor work; some plowing done; potatoes planted. A tornado hit three miles southeast of here and the roar could be heard at this town about 3.50 p. m. to 4.20 p. m. on the 15th; high wind and almost a cloudburst.

Lamonte—Oats all seeded; some up. Early gardens and potatoes planted. Wheat condition good. Prospects for fruit very good; plum and peach trees coming into bloom.

Warsaw—The month was ideal for farm work; and wheat is in excellent condition. Fruit prospects fine. Meadows and pastures coming nicely; oats good; plowing advanced.

Eldon—Early gardens made. Oats seeding about finished. Plowing for corn well under way.

Farmington—While there was more rainfall than in either January or February, the month was inclined to be dry and fine for outdoor work. The soil is in splendid condition, and an unusual amount of plowing has been done. Wheat is looking fine.

DAMAGING STORMS.

The 14th-15th was a period of severe thunderstorms and heavy rain over practically all the State north of a line drawn from Kansas City eastward to Louisiana. Strong squall winds and hail were reported from several stations, but with no material damage resulting. The rains caused almost all creeks and rivers tributary to the Grand, Platte, and Nodaway rivers to run bank full, or to overflow the first bottoms. Damage resulting from floods in this area is estimated at $10,000.

Excessive rainfall conditions prevailed also over much of the southeastern lowlands which resulted in some temporary flooding of a local character. No damage has been reported, but all farm work was for a time impossible.

One or perhaps two storms of a violent nature visited portions of Vernon, St. Clair, and Henry counties on the afternoon of the 15th. While but one observer claims to have seen a funnel-shaped cloud, and while the wreckage does not indicate, in many cases, a well defined rotary motion, there is sufficient evidence to classify them as tornadoes, though of minor intensity perhaps. The first point of damage was three miles southwest of Nevada, at 4.15 p. m. Here, in a path one mile long and a fourth as wide, a small school house, a farm residence, four large barns, and a silo were completely demolished; while two other farm residences were badly damaged. The damage is estimated at about $16,000. The direction of the storm was from southwest towards the northeast.

The following notes are taken from the report of the observer at Appleton City, the next point from which damage is reported:

"The 15th of March was a day of frequent slow showers; about 3.50 p. m. rain began to fall in earnest, and about 4.20 p. m. reached almost the proportions of a cloudburst and continued in this manner for about 20 minutes. The wind had been in the southeast most of the day until about 4.00 p. m., when it suddenly began to blow very hard from the southwest, and the sky became quite dark. During the time of excessive rainfall and strong wind, the wind veered to the northeast for a short time.

"About 4.30 p. m., a 'twister' struck the farm of George Clark, three miles southeast of here, making a loud roar while in progress that could be heard plainly in this city. No funnel-shaped cloud was observed, but the wreckage shows a rotary storm wind. The path was about 150 feet in width. Two large stock barns were demolished; seven milk cows were killed and other stock injured. Parts of the barns were carried about one-half mile away. A concrete and tile silo at the east end of the dairy barn was undamaged, and a small building standing between the two barns was untouched. The storm lifted before passing beyond this farm, though it was near enough to the ground to take the tops off of the trees at a farm place a mile further eastward.

"At least $5,000 damage was done; . . . . one boy was slightly injured on the knee by flying debris."

Other details of the report are omitted for lack of space. The storm moved from southwest to northeast, and was probably a secondary storm formed in the same area of air instability which extended from Vernon County northeastward to Henry County, the next point of damage.

The storm seems to have lost force by the time it reached Clinton, the damage being largely confined to wrecking small buildings, hurling light objects through windows, etc. The path of damage was about 50 to 60 feet in width, and although rotary winds are evident, no funnel cloud was observed. Damage in Clinton estimated at $5,000 with an additional $2,000 loss to rural dwellings. It reached this point at about 5.00 p. m. and is likely the same storm that visited the vicinity of Appleton City.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., April, 1919. No. 4

GENERAL SUMMARY.

April, 1919, was without unusual features, the meteorological elements differing but little from their normal values. Brisk to strong winds occurred on several days but no material damage was done, except in the eastern part of Butler County on the 23d. Local hail storms caused some damage in Buchanan, Boone, and Butler counties, widely separated points, on the 21st, 23d, and 29th; for detail report see page 32. The northern tributaries of the Missouri River were bankfull, and overflowed some of the lower bottom lands. Freezing or near freezing temperatures were general on the 26th, but damage was confined to localities in the northeastern plain, and in the valleys and other low places in the Ozark Plateau.

Farm work was delayed by wet soil in the northwestern plateau but made good progress elsewhere. As a whole, the weather was favorable for winter wheat, and for meadows and pastures.

TEMPERATURE.

The monthly mean temperature for the State as a whole, as determined from the records of 66 stations, was 55.3°. This is practically normal; and 4.5° warmer than the same month in 1918. The temperature distribution was not uniform. The southeastern lowlands, eastern and western Ozarks, and most of the northeastern plain were warmer than normal; while the central Ozarks, the Gasconade and Osage valleys, and the Missouri from about Warren County to Cooper County, and nearly all of the northwestern plateau were cooler than normal. The 1st was the coldest day of the month, with 32° or lower generally, and a minimum of 20° at one station, Goodland, Iron County. Day temperatures of 80° or higher occurred on the 6th, and 22d; and reached nearly that value on the 7th, 14th, and 23d. Freezing temperatures occurred on the morning of the 26th generally.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, wai 3.01 inches. The departure from the normal for 74 stations having 10 or more years' record was minus 0.64 inch. The precipitation was unevenly distributed. It was excessive in the northwestern plateau, in six or seven counties in the southwestern plain, and locally in the southeastern lowlands; in the remainder of the State it was quite noticeably deficient. Showers, however, fell during each decade, the heaviest and most general falling on the last days of the month. The greatest local monthly amount was 5.72 inches, at Grant City, and the least was 1.48 inches, at Goodland. The greatest fall in any 24 consecutive hours was 3.05 inches, at Bolivar on the 28th.

Snow flurries occurred on the 25th and 26th quite generally but melted as fast as they fell.

WIND.

The prevailing winds were from the south. The average wind movement for the State, based upon the reports of 8 stations equipped with anemometers, was 8,161 miles, 11.3 miles per hour or about 10 per cent above normal. Brisk to strong winds were general on the 10th, and 19th and were strong locally on 6th, 7th, 8th, 9th, 14th, 16th, 21st. and 23d.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State was 223, or about 56 per cent of the possible, and about 5 per cent below normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense--4th, and 30th.

Frosts, light--2d, 11th, 17th, 18th, 24th, and 26th. Heavy--1st, 18th, and 26th. Last killing frost, on the 26th, in northeastern plain, and in valleys and low places in Ozark Plateau.

Hail--5th, 6th, 8th, 13th, 14th, 17th, and 27th. Severe hail fell in Buchanan County on the 21st, eastern Butler County 23d, and in Boone County 29th. (See page 32.)

Halos, solar--2d, 5th, 8th, 11th, 13th, 18th, 23d, 24th, 25th, and 26th. Lunar--6th. 12th, and 13th.

Thunderstorms, more or less general--7th, 9th, 14th, 21st, 22d, 23d, and 29th. Local--5th, 6th, 8th, 15th, 16th, 21st, and 28th.

ERRATA FOR FEBRUARY, 1919.

Arcadia--Date of highest temperature, 11th. Jefferson City--Monthly mean temperature, 33.6°; departure from normal, plus 2.8°.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports used in determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries. ‡‡ Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F
No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for April, 1919.

*Observations taken at 7.45 a.m., Summer Time. †Observations taken at 5.30 p. m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon.

HAIL STORMS.

April 21st—Doniphan County, Kans., and Buchanan County, Missouri.

A hail storm of marked severity and unusually wide extent had its origin about two miles west of Bendena, Kans., at approximately 7 p. m. It moved a little south of east, Brenner, Kansas, being near the center of the path of greatest destruction, crossed the Missouri River in the vicinity of Halls, Mo., and continued its easterly course across Buchanan County to the vicinity of Gower, Mo. The width of the destructive part of the storm varied from one to three miles and its total length was 35 miles. On either side of the path of greatest destruction, light to moderate hail was noted for two or three miles. While difficulty was experienced in securing accurate information as to the duration of the fall of hail at any given point, it is believed that it continued for not less than five minutes.

Damage done in the middle part of the path of the storm by hail-stones, which were as large as walnuts, and in some cases even larger, was very severe, especially to orchards, wheat and alfalfa. Numerous fine apple orchards located in or near the center of the path of the storm were seriously damaged. In some cases as high as 75 per cent of this year's apple crop is reported destroyed, but the greatest damage, orchardists say, is to the trees, both young stock and mature trees, by the bruises and abrasions of bark and fruit spurs. The trees were cut and gashed as if by a bombardment of shrapnel, making them a prey to fungus diseases as well as weakening each tree by loss of vitality expended in healing wounds. The estimated loss in the Kenmoor apple orchard of 200 acres, which is about 12 miles south of St. Joseph, Mo., is $15,000 to $20,000. Trees were in full bloom.

Much of the land over which the storm passed is in wheat, and prospects prior to the storm were for a splendid yield; the growth was rank and much of the wheat was knee high and jointed. Some of the wheat was broken down and some pounded into the ground, the damage in many fields exceeding fifty per cent. The first crop of alfalfa on many farms will be a total loss.

Roofs and windows on the north and west sides of buildings suffered considerable damage and in a few instances young pigs and lambs were killed. At Bendena, a store building was unroofed by the wind.

Drifts of hail that piled up on the north side of buildings did not all melt until five days after the storm, although the maximum temperature on the day following was above 80° and readings above 50° occurred on each of the other four days.

In some recently plowed fields the hail fell with such force as to make pits like miniature shell craters.

A heavy dashing rain accompanied the hail storm and caused considerable damage by washing. W. S. Belden, Meteorologist.

April 23d—Butler and Stoddard Counties.

About 5.30 p. m. a severe hail storm, attended by damaging winds, caused considerable loss from Fisk, east-central Butler County, to near Marco, a village 23 miles nearly due east, in Stoddard County. The exact area of country affected cannot be determined, damage seemingly occurring in several narrow strips of varying width and length. Damage was chiefly to growing crops; wheat, the principal crop damaged, was from knee high to waist high, and many large fields were seriously damaged. Alfalfa and gardens were beaten into the ground, and the fruit crop on some farms will be a total loss. Two men were seriously injured in runaways, caused by their teams becoming unmanageable from pelting hail stones and high wind. At Ash Hill a small church was blown down, with a loss of about $900. Many fruit and shade trees were uprooted in the wind.

April 29th—Boone and Callaway Counties.

The most severe hail storm for many years, according to old residents, visited west-central Boone County between Rocheport and Columbia, and in the vicinity of Stephens, Callaway County. Light hail occurred generally over intervening territory during the passage of the storm, which was 3.15 p.m. at Rocheport and 4.10 p. m. at Stephens.

Between Rocheport and Columbia the area of serious damage was about three miles long and two miles wide. The duration of the fall of hail was about 12 minutes, though several reports indicate falls of nearly 30 minutes. At the end of the storm, hail lay on the ground from one to three inches deep, and in low places, where washed by the heavy accompanying rain, the depth was from six inches to three feet. Hail was in evidence on May 3d, five days later in low places in the wheat fields and other sheltered places. The hail stones ranged from the size of small marbles to about one inch in diameter. The easterly limit of the damage was about seven and one-half miles west of Columbia.

At Stephens, the area of severe damage was about one-half mile in width and a little over two miles long. Where the damage was worst, hail lay "shoe-top deep" after the storm passed; large stones of irregular dimensions and shapes were reported. The hail fall lasted about twelve to fifteen minutes.

Damage in both localities was severe, but confined generally to crops. Wheat, oats, gardens and meadows were beaten until practically all growth prior to the time of the storm was ruined. It is doubted that wheat will recover. All fruit trees were stripped, in fact most trees were left with practically bare limbs. No damage to buildings occurred, but window panes on the west sides of nearly every home in the area affected were broken. A few young pigs and quite a few young chickens were killed, although the pigs may have drowned. Both areas were well developed farming sections. Rough estimates of crop loss vary from $20,000 to $25,000. O. R. R.

OBSERVERS' REMARKS.

Brunswick--On the 18th, and 26th ice formed in low places, but n special damage resulted.

Appleton City--The month was very favorable for farm work. Rainfal was sufficient for present needs. Wheat, oats, and fruit in good condition. Corn planting progressing.

Lamonte--Very high wind on 9th, 10th, and 19th. Snow flurries o 15th, and 26th. Light frost on 18th.

St. Catharine--April has been windy and cool. Grass looks fine an wheat is excellent; oats and grass are beginning to grow. The mont ended wet and foggy.

Nevada--There was frost on the 18th, and 26th but did little damage

Warrenton--Cool cloudy weather has prevailed with only a few clea and warm days during the last two weeks.

Warrensburg--Light frost on the mornings of the 25th, and 26th bu no damage.

Avalon--Wheat, meadows, and pastures making fine growth. N peach blossoms but cherries and plums are safe. Not much corn planted too cool and wet.

Warsaw--The ground was getting dry but a good rain set in on th 25th and continued for several days supplying needed moisture.

Grant City--Most of the month was too wet for farm work. No plowing for corn. Wheat, rye, and pastures making good growth. Whea getting rank; may be more straw than heads.

Kidder--The past month has been cool and cloudy most of the time Ground too wet and cold for vegetation except grass and wheat, whic are growing fast.

Doniphan--Severe frost on 26th but fruit not killed.

Birchtree--Light snow fell for about two hours on the 25th. Frost o the 26th, destroying vegetation in some localities.

Farmington--Most of the month was dry but the rains of the last fou days did much good. Some early garden truck was killed by frost of th 26th, but not much harm done; fruit prospects good generally.

Houston--The month ended with a good rain, which revived vegetatio Oats and meadows are short but a few days of warm sunshine will brin them out.

Lebanon--We had heavy frosts several times during the month bu very little damage resulted. Wheat is in fine condition and is puttin out stalk.

Lockwood--The month has been cool and wet. Corn planting delaye ground in bad working condition.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., May, 1919. No. 5

GENERAL SUMMARY.

May, 1919, was cool, cloudy, and wet, though there were only a few days on which the sun did not shine. It is the first month thus far of the year to supply surplus moisture to the soil, and also the first with temperatures less than normal. There were no severe storms, though local hail damage occurred at a few places, and a local wind, having some characteristics of the tornado, traveled northeast across Gentry and Harrison counties. For detail report on storms see page 40.

Farm work was delayed, especially during the latter half of the month, when rain fell almost every day. There was rather too much rain for the wheat crop, though at the close of the month the condition was still very good. The first hay crop has been large and of good quality, but harvested under difficulties, considerably damaged by rains. Live stock has reached excellent condition.

TEMPERATURE.

The monthly mean for the State, as determined from the records of 65 stations, was 62.0°. The mean departure from the normal for 63 stations having 10 or more years' record was minus 2.5°. The month was about 6° cooler than the same month in 1918, and about 3° warmer than May, 1917. All divisions show quite noticeable temperature deficiency, but the coolest part of the State was from about Macon and Marion counties to Shannon and Bollinger, and from Laclede and Pettis counties to the Mississippi River, the departure from the normal ranging 3.5° to 7.7°, the larger values occurring in the Gasconade and the lower part of the Osage Valley. The last three days of the month were the warmest, a few stations at widely separated points experiencing a maximum of 90° or higher; there were no frosts or freezing temperatures.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, was 5.80 inches. The departure from the normal for 74 stations having 10 or more years' record was plus 0.87 inch. In the northeast plain the rainfall was 1.54 inches greater than normal; in the northwest plateau slightly below normal, and in other divisions moderately above normal. The precipitation was unevenly distributed. The wettest parts of the State, where the monthly amounts varied between 7 and 9 inches, included that part of the Ozarks from the Osage River south to the White River, and eastward along the northern slope including the Gasconade, the Meramec, and the lower Missouri River, and reaching to Audrain County; and in the northern border counties from Nodaway to Knox and Scotland counties. Except on the first two days, and from the 10th to 14th, inclusive, showers were more or less general and of daily occurrence. About half the stations recorded rain on 15 days, and a few as many as 20 days. The greatest amount in any 24 consecutive hours was 4.50 inches, at Trenton, Grundy County, on the 3d. There was some flood damage in the Grand, Chariton, Osage, Neosho and Black river bottoms.

WIND.

The prevailing winds were from the northeast. The average wind movement was 6,584 miles, based upon the records of 8 well located stations equipped with anemometers. There were no strong or damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of clear days for the State was 10, or about 4 less than normal. The average number of hours of sunshine was 250, or about 56 per cent of the possible, and about 7 per cent below normal. This May received about 13 per cent less sunshine than May, 1918.

MISCELLANEOUS PHENOMENA.

Fogs, dense--20th, 26th, and 27th. Hail--3d, 4th, and 23d. Halos, solar--3d, 7th, 12th, 17th, 23d, 25th, 26th, 28th, 29th, and 3th. Lunar--6th, and 11th.

Thunderstorms (local)--5th, 7th, 18th, 20th, 22d, 23d, 26th to 29th, inclusive. More or less general--2d, 3d, 4th, 6th, 15th, 16th, and 19th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports ar used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing: for example, ^{b} represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for May, 1919.

*Observations taken at 7.45 a.m., Summer Time. †Observations taken at 5.30 p.m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon.

DAMAGING STORMS, MAY, 1919.

The month was unusually free from damaging storms considering that it was one of frequent and heavy rainfall, on many days of which the rains were heavy to excessive in amount. The Rock Island and Wabash railways were forced to suspend service several days during the first week because of washouts in the vicinity of Trenton, Gallatin, and Pattonsburg. On the 3d and 4th, 5.62 inches of rain fell at Trenton.

On the afternoon of the 15th, by far the worst hailstorm ever known in that section struck Moberly and adjacent parts of Randolph County. The damage was worst in the eastern portion of the city where stones the size of large marbles fell continuously until the ground was covered with a layer several inches deep. During the hailstorm it was difficult to distinguish houses across the street. Though the storm occurred at 5 p. m. there was hail still on the ground the following morning. Damage to roofs and glass was considerable, though there were no heavy losers. Gardens, fruit, and grain crops suffered severely in small areas throughout the county.

May 15th, Appleton City—Severe hail from 8.30 p. m. to 8.40 p. m. Hailstones measured from 4 to 6 3-8 inches in circumference, though most of them were the size of dimes and quarters. It was the first hail of this year, and one of the worst for several years in the section where it was most severe. The territory southeast of here to about 8 to 10 miles away was damaged the worst, and embraced an area of perhaps 10 miles long by three miles wide; the storm came in from the southeast. Damage to roofs and glass in this city was considerable, the greenhouse having hardly a dozen panes left in a whole condition. Crops of hay and grain were damaged considerably, but the worst loss perhaps was to strawberries, potato fields, fruit trees, and gardens. Corn that was up was hurt to some extent. There was no high wind with the storm, and the hail came straight down most of the time. It was attended by excessive rain. (Extract from report of W. G. Bigelow, co-operative observer.)

On May 17th what seems to have been a tornado of minor intensity developed a few miles northeast of Cainesville in the New Harmony Church community about 11 p. m. Several farm residences were slightly damaged, but the church was completely wrecked, being carried bodily from the foundations and large portions of walls and roof carried several hundred yards. The piano was deposited in a large clump of bushes 100 feet from the site of the church, while song books were found nearly one-half mile away. There is a report of similar damage near Albany, about 40 miles southwest of this point, but this has not been verified as yet.

O. R. R.

OBSERVERS' REMARKS.

Gorin—Month has been wet, but there were no damaging storms.

Kirksville—While an unusual amount of rain fell, planting and prospects are fine.

Louisiana—A few hail stones fell on the 20th.

Macon—May 10th, abundant moisture; 15th, corn planting in progress; on the 14th the Charitan River overflowed, destroying many wheat fields; 27th, corn in danger, bottom lands probably will be replanted; 30th, warmth and sunshine helping materially.

St. Catherine—On the 4th the creek overflowed the bottoms, but left the bottoms the afternoon of the 5th. High east wind with heavy rain. No corn planted on bottom lands; too much water. Corn not more than one-half to three-fourths planted.

Warrenton—Too much cool, cloudy, rainy weather. Hail did some damage in restricted areas.

Caruthersville—Excessive rainfall very bad for hay. Cotton and corn damaged and delayed in planting in many places. Season so far generally unfavorable.

Jackson—This has been a very cool, wet month.

Farmington—While there were no torrential, washing rains, common at this season, the continued wet weather delayed farm work very much. The last week was warm but up to that time it was too cool for crops. Wheat is not so promising as first expected.

Gano—The soil has not been in condition to work since the 16th. Corn not all planted yet. Pastures good and live stock doing well.

Houston—We have had lots of rain and now need warmth and sunshine. Corn needs cultivation; and some yet to be planted.

Lebanon—The farmers are far behind with corn planting and what corn is up is badly in need of cultivation. The wet weather damaged wheat to some extent.

Lockwood—A very unfavorable month for farming, as it has been wet and cool. Wheat and oats are good but corn will be late. Pastures good.

Appleton City—There was too much rain for regular farm work. Heavy hail storm night of the 15th; the stones were from the size of a pea to 6 and 3-8 inches in circumference and 4 inches in diameter; some damage to wheat southeast of here. All crops doing well, but too much rain for cultivation.

Harrisonville—There were no storms this month, other than thunderstorms.

Lamonte—Corn is grassy and needs dry weather and sunshine. Wheat lodging considerably. Oats fair and pastures good.

Nevada—There was hail on the 15th, but no material damage.

Warsaw—The Osage River went to 23.2 feet, 1.2 feet over flood stage; some damage in the bottoms.

Avalon—Meadows are doing well. Wheat and oats have made rank growth. Rather too wet for corn. Wheat in bottoms nearly ruined by overflow.

Grant City—The month was unfavorable for farm work. Excessive rains delayed plowing and planting, but is now nearly completed. A good stand of corn, and wheat excellent; pastures and meadows good.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., June, 1919. No. 6

GENERAL SUMMARY.

The weather of June, 1919, in Missouri, did not vary a great deal from the usual. The first week, and the last three days were cooler than the normal, but the remainder of the month was uniformly warmer than normal. The sunshine and wind movement varied but little from the average values. In some respects it was a rainy month; it was excessively wet in some localities, moderately so in others, and relatively dry in a few. Showers, however, fell almost daily in some part of the State; the evaporation, though, was large and quite steady.

Most of the Missouri River tributaries were out of banks for a short period during the first ten days of the month, but the Missouri itself remained within its banks. A few local wind and hailstorms occurred. (For detail report on storms see last page.)

There was rather too much rain, as a rule, for best wheat results, and some corn in bottoms was abandoned because of rank weed growth; at the close of the month, however, the general crop condition was very good, while pastures and meadows were in a highly satisfactory condition.

TEMPERATURE.

The monthly mean temperature for the State, based upon reports of 62 stations, was 75.0°. The mean departure from the normal for 61 stations having 10 or more years' record was plus 1.9°. The month was warmer than usual in all sections, but the temperature was least marked in the Ozark Plateau and southwestern plain than elsewhere. The greatest excess, averaging about 4° a day, occurred at stations along the eastern side of the State from Caruthersville, Pemiscot County, to Steffenville, Lewis County, though the extreme northwestern and many northeastern stations also experienced quite marked excesses. At Caruthersville the day temperature reached 90° or higher on 25 days, and 100° or higher on 4 days, 15th to the 18th, inclusive. Several scattered stations recorded 90° or higher on but 2 days, and others from 3 to 5 days. June, 1918, averaged about 2° warmer than the present month, while the maximum was 110°, as compared with 104° this June.

PRECIPITATION.

The average precipitation for the State, 74 stations reporting, was 5.59 inches. The mean departure from the normal for 71 stations having 10 or more years' record was plus 1.11 inches. The precipitation was unevenly distributed. From about Greene County to St. Louis County it was less than 4 inches; also along the Mississippi River to the Iowa border, except Lewis County; and in Cass and Bates counties it was less than 3 inches; elsewhere the monthly amounts ranged from over 5 inches to more than 10 inches, the greatest falls occurring in Henry and Vernon counties. The greatest amount falling in any 24 consecutive hours was 4.21 inches, at Trenton on the 19th; at eight stations 2.50 inches or more fell in less than 24-hour periods.

There was some flood damage in the Grand, Chariton, Meramec, Current, Black and Neosho watersheds during the first 10 or 12 days of the month.

WIND.

The prevailing wind was from the south. The average wind movement was 5,283 miles, 7.3 miles per hour, or about 10 per cent less than normal. Strong local winds occurred on the 8th, 16th and 26th. (For more detailed report on storms see page 48.)

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the reports of 6 well selected stations having sunshine records, was 316, or about 73 per cent of the possible and about 3 per cent above normal.

MISCELLANEOUS PHENOMENA.

Hail--8th, 17th and 18th. Halos, solar--21st, 27th, 28th and 30th. Lunar--7th, 8th, 9th and 10th.

Thunderstorms, general--1st, 2d, 8th, 9th, 10th, 16th, 17th, 18th, 19th, 21st and 22d. Local--3d, 6th, 11th, 12th, 13th, 20th, 23d, 24th, 25th, 26th, 27th and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports ar used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for June, 1919.

*Observations taken at 7.45 a.m., Summer Time. †Observations taken at 5.30 p.m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon.

DAMAGING STORMS, JUNE, 1919.

Excessive rains over the southeast lowlands and eastern Ozark Plateau on the 3d caused numerous creeks to overflow the first bottoms. The Current River rose 10 feet on the 4th at Doniphan. No estimates of the damage are available.

On the 8th severe local thunderstorms with high winds and hail caused considerable damage to grain and growing crops in Mississippi county and adjacent portions of Kentucky and Illinois. The damage is estimated from one-fourth to one-half million dollars, chiefly to the ripening wheat, which was laid flat. A large levee camp below Birds Point was demolished, and a negro killed by a tree falling across the tent in which he was sheltered.

On the 17th, from 4.30 to 5.30 p. m. St. Louis County was visited by a severe thunderstorm of marked electrical intensity. Lightning caused several fires in the city of St. Louis and demoralized public utilities for a time. Awnings, telephone, telegraph and light and power poles and wires and trees were broken in various parts of the city, and often thrown into the streets. In Alton two persons were killed by lightning. Wind and hail damage to wheat and truck crops was considerable in adjacent parts of the county.

On the 19th numerous severe local thunderstorms were reported over the northern half of the State. From 2 to 4 p. m. 4.21 inches of rain fell at Trenton; at 3 p. m. a violent storm struck near Newtown, 25 miles northeast of Trenton, where a large barn filled with feeds and machinery was struck by lightning and burned; at New London, Ralls County, many small buildings were blown down, window panes broken, and trees uprooted by the wind; at Hannibal, Marion County, damage was of a minor character such as to chimneys and limbs of trees, though in adjacent sections much damage was caused to the wheat. No reports of hail damage were received.

On the night of the 25-26th severe local storms visited portions of the northwest. Damage was chiefly due to high winds, which reached velocities of 50 to 54 miles per hour at both Kansas City and St. Joseph, points where anemometers are located. Extensive damage to wheat occurred in Jackson, Clay, Platte, Clinton and DeKalb counties, being most severe in the two first mentioned, where some fields will never be cut, while in others the loss will range from 15 to 30 per cent. Damage of minor importance was reported also in Boone, Callaway, St. Francois, St. Clair and Cape Girardeau counties. O. R. R.

OBSERVERS' REMARKS.

Brunswick—Excessive rains at the time rye was in bloom injured the crop.

Kirksville—This has been a fine month for farmers.

Macon, 8th—Wheat not materially damaged, heading fairly well. 12th—Corn replanting in progress, the first planted being weeded out in good shape; hay excellent. 24th—Corn in good stand, hot weather helping considerably; oats ready for harvest.

Mexico—There was a high wind on the 24th; some slight damage.

St. Catharine—June has been hot and sultry, scarcely any air circulation on some days. Corn has been laid by.

Warrenton—Farm and garden work has been retarded by excessive moisture much of the time, but the last part of month was favorable and resulted in much improvement.

Poplar Bluff—There was a wind storm on the 25th; not much damage.

Cassville—There was a thunderstorm with hail on the 19th.

Eldon—It has been too dry for pastures and gardens, but corn looks well; wheat is all cut and threshing is in progress.

Farmington—There was an unusual amount of cloudy weather but the sunshine seems to have been sufficient as this has been a fine crop growing month.

Houston—We have had an abundance of rain, and corn has not had the cultivation needed. Some wheat not yet cut.

Lebanon—Wheat is mostly all cut and in good condition. Corn is in fine condition.

Lockwood—This has been a very seasonable month. Wheat and oats harvest about completed.

Appleton City—The month has been rather too wet for best farm work. Pastures are good.

Lamonte—Some corn in bad condition because of excessive rains, and heavy wheat harvest. Some wheat fields abandoned because of badly lodged condition and wet ground.

Warsaw—The month was unusually wet, greatly retarding all farm work; marked improvement, however, last of the month.

Avalon—Splendid crops of all kinds; and good harvesting weather, but a poor bee season.

Grant City—Excessive rains hindered farm work. Corn looks well; and wheat harvest is in full progress.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., July, 1919. No. 7

GENERAL SUMMARY.

July, 1919, in Missouri, was characterized by a large amount of sunshine, insufficient moisture over most of the State, and a general excess in temperature, though the last element was not markedly unusual. The general conditions were largely a repetition of those prevailing during the three past Julys. There were a few hail and windstorms, but the resulting damage was confined to small areas.

July is the critical month for the corn crop. For best results it should have well distributed and heavy rainfall. At the close of the month much upland corn was suffering because of the lack of rain, and a small per cent was already past reviving. Harvesting, threshing and haying made good progress. Pastures in many districts were brown and scanty. A few stockmen were feeding but as a rule live stock were in good condition. The best apple outlook comes from the eastern Ozarks and the Missouri River hills.

TEMPERATURE.

The monthly mean temperature for the State, 63 stations reporting, was 80.0°. The mean departure from the normal for 60 stations having 10 or more years' record was plus 2.3°. The warmth was uniformly distributed but the temperature excess was less marked in the Ozark Plateau and southwestern plain than the other sections. The first four and last nine days were the warmest, the rest of the month experiencing about normal heat, except the 11th and 12th. Maximum temperatures reached or exceeded the 100° value on the 4th, 11th, 12th, 25th, 30th and 31st. The average number of days above 90° was 24.

PRECIPITATION.

The average precipitation for the State was 2.33 inches. The mean departure from the normal for 71 stations having 10 or more years' record was minus 1.73 inches. The rainfall was below normal in all sections, the southeast being the driest and the northwest the wettest. Six stations received about normal precipitation, and another four received less than one inch of rain. Showers were more or less general from the 1st to the 5th, and 19th to 23d, otherwise scattered though locally heavy on a few dates. The greatest local monthly fall was 8.52 inches, at Conception, and the least was 0.32 inch, at Warsaw. The greatest amount in any consecutive 24 hours was 4.55 inches, at Conception on the 5th. Drought conditions prevailed at the close of the month in most districts.

WIND.

The prevailing winds were from the south. The average movement, based on the records of 8 stations equipped with anemometers was 5,372 miles, or about 7.2 miles per hour, which was about normal. Quite a strong general wind prevailed on the 11th, and high local winds occurred on the 31st. See last page for detailed report on storms.

SUNSHINE AND CLOUDINESS.

There were 23 clear days and only two cloudy days. The average number of hours of sunshine was 393, or 87 per cent of the possible and about 16 per cent greater than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense—2d and 6th. Hail—9th and 11th. Halos, solar—11th, 14th, 15th and 19th. Lunar—8th. Thunderstorms, general—5th, 9th, 10th, 11th, 14th, 29th and 31st. Local—4th, 6th, 7th, 12th, 15th, 17th, 19th, 27th and 28th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries. ‡‡ Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for July, 1919.

*Observations taken at 7.45 a.m., Summer Time. †Observations taken at 5.30 p. m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon.

DAMAGING STORMS.

The three-day period, July 10th to 12th, was the only one of general rain during the month; on the 11th occurred the most general rain and amounts were moderate to heavy at many stations. Damage of a minor nature from high winds was reported from several stations on this date, but only one section sustained damage to any considerable extent. This embraced the eastern half of Boone County from Sturgeon on the north to Ashland on the south, and those portions of Audrain and Callaway counties west of Mexico and Fulton. Roughly, the width averaged 20 miles and the length 40 miles. Over most of this area damage was light but at several points it was quite severe and strongly evidenced tornadic action.

From a point about five and one-half miles southwest of Mexico, there was a strip three-fourths mile wide and three miles long, extending in a northwest to southeasterly direction, where barns, silos, windmills, outbuildings and trees of all sizes were blown down and demolished. Flues were blown from the houses, roofs damaged and window panes broken in; trees of the largest growth were uprooted or stripped to bare stumps; corn fields were leveled and shocked grain considerably damaged. In Centralia, travel was impossible for several hours after the storm, owing to the debris of trees littering the streets. Auxvasse and vicinity was another point of considerable damage to all kinds of property. Columbia sustained the loss of many fine trees and some damage to roofs, glass, telephone insulations, etc. Sturgeon, Mexico and Fulton also suffered some damage.

The damage to property will exceed $50,000, while the loss to crops will aggregate another $130,000. The storm occurred about noon; its direction was from the northwest towards the southeast, though damaging wind velocities were noted at all points of the compass from east through north to west. O. R. R.

OBSERVERS' REMARKS.

Fayette—A very severe straight wind on the 11th blew down scores of trees.

Gorin—From about the 12th to the end of the month hot weather prevailed.

Macon—Wheat, oats and hay harvest about completed by the 10th; about half crop. A good rain on the 12th benefited corn; there was some small hail damage. At the close of the month corn was looking fine, but rain was needed.

Mexico—There was a high wind on the 10th, and also at noon of the 11th. Considerable damage was done in the west portion of the town; houses and barns were demolished and crops blown down.

St. Catharine—There was plenty of moisture during the first half of the month but the latter half was dry. Rain began at 8.30 p. m., 31st, and continued all night. Corn is not injured to any great extent.

Warrenton—Only two good rains during the month and both close together. Corn is beginning to suffer. Chinch bugs apparently increasing.

Eldon—A great deal of fall plowing has been done.

Farmington—The drought is becoming serious as there has been but 0.32 inch of rain since the 25th of June. All crops are suffering.

Gano—A strong northwest wind on the 11th did considerable damage, It is getting very dry.

Lebanon—Most of the corn need rain, but some is in good condition.

Lockwood—This month has been hot and dry but the weather was favorable for threshing from stack and shock. Corn is beginning to suffer. Fine crop of wild hay. Apples are falling badly.

Appleton City—The weather was too dry for best results in growing crops but was good for threshing. Good hay crop.

Warsaw—This has been the driest July on record for this section. All growing crops are greatly injured.

Avalon—This has been a favorable month for farm operations generally; but rather a poor season for honey. There was a good rain on the last night, which will about make the corn crop.

Grant City—July was a good month for farm work and crop growth, and business generally.

Kidder—The month was warm and dry; we have had no rain of consequence since the 16th.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., August, 1919. No. 8

GENERAL SUMMARY.

August, 1919, in Missouri, was not altogether favorable for crops. The first half of the month averaged warmer than the normal and the latter half cooler than normal. The rainfall was unevenly distributed and fell at irregular intervals, the intervals between good rains being rather too long for best results. There was no markedly excessive heat, except on the 3, 4, 5 and 6, when the day temperatures ranged around or well over the 100° value. The last week of the month was exceptionally pleasant; in fact, except on the few days mentioned, the month was pleasant from the side of personal comfort.

At the close of the month the condition and progress of the corn crop in most of the northern half of the State was fair to good; in other sections, especially the eastern border counties and most of the southern section it was rather poor, and fast deteriorating. Wheat threshing made fair progress.

There were a few local hail and wind storms. For detail report of storms see last page.

TEMPERATURE.

The monthly mean temperature for the State, as determined from the records of 61 stations, was 75.7°. The departure from normal for 60 stations having 10 or more years' record was minus 0.50. The mean temperature was markedly above the normal only for short periods of three or four days at a time. From the 3rd to the 6th were the warmest days of the month, when maximum temperatures ranged from 95° to 100° or higher, the highest being 106° on the 6th. The coolest period was from the 25th to the 28th inclusive.

PRECIPITATION.

The average precipitation for the State, 78 stations reporting, was 4.29 inches. The departure from the normal for 70 stations having 10 or more years record was plus 0.49 inch. The precipitation fell as showers at irregular intervals, and, except on the 15th and 16th, and 27th to the 29th, were as a rule local. Drouth was more or less prevalent in the southern half of the State until the last of the month, and in most of the northern border counties. An unusually heavy rain storm occurred during the 27th, 28th and 29th in Jackson, Johnson, Pettis, Benton and portions of adjoining counties. The Blackwater River and its tributaries were in flood, and only the prevailing dry condition of the soil prevented heavy damages in some localities. Warrensburg received 11.90 inches; Lamonte, 7.00 inches, and Kansas City 5.66 inches in a twenty-four hour period on those dates.

WIND.

The prevailing winds were from the southwest. The average wind movement, based upon the records of eight well placed stations equipped with anemometers, was 5729 miles, or 7.7 miles an hour, and about 14 per cent greater than the average. A high wind occurred at St. Louis on the 20th, and at St. Joseph on 7th. For more detailed report on storms see last page.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of six stations equipped with sunshine recorders, was 313, or 74 per cent of the possible and about 2 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fog, dense—16th, 24th and 30th. Hail—6th, 11th, 12th, 20th and 27th. Halos, solar—7th, 8th, 12th, 25th, 28th and 29th. Lunar—10th, 11th, 13th and 19th. Thunderstorms (general)—7th, 13th, 15th, 20th, 28th and 29th; (local) 4th, 5th, 6th, 11th, 12th, 16th, 21st, 24th, 25th, 26th and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for August, 1919.

*Observations taken at 7.45 a. m., Summer Time. †Observations taken at 5.30 p. m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon.

OBSERVERS' REMARKS.

Brunswick—On the 16th there was an unusual heavy thunderstorm and strong wind.

Gorin—The month ended dry.

Kirksville—There was a violent rain and wind storm on the 7th, which damaged much grain in the stack and shock.

Macon—The rain of the 7th, was very beneficial to corn generally and especially late crops. With threshing nearly done, corn safe from frost and everything looking fine, this section never presented a better outlook.

Mexico—High winds on the nights of the 6th, 7th and 15th.

Oakfield—Very high west wind veering to the Northeast during the night of the 15th-16th, blew down corn. On the 15th, Leopold Schneider was killed by lightning in Pacific. On the 29th, the barn of Fred Gaehle of St. Louis county, was struck by lightning and one horse was killed and the barn and contents were burned.

St. Catherine—On the 15th, rain fell at an excessive rate, one inch and twenty hundredths in twenty minutes. Corn in this county is good and is still green but it needs sunshine. Clover is in bloom and will make seed.

Warrenton—The first half of the month was warm and dry. The rains of the last half were accompanied by cooler weather and also put the ground in condition for fall plowing.

Caruthersville—The rains of the 15th and 16th actually made cotton and corn crop for the entire county.

Farmington—The first twenty days of the month were a continuation of the drouth conditions of July. The few showers and cloudy weather of the last ten days were reviving especially to pastures.

Houston—We are having some cool nights and days and also some rains which are very beneficial.

Lebanon—The corn crop was badly injured during August on account of the lack of moisture, and will not make an average crop.

Lockwood— August was a very dry month but was favorable for threshing. The corn crop is a failure and the ground is too hard to plow. Wheat acreage will be less this year.

Lamonte—Some wheat is still in the shock and the loss is heavy. Much corn in the bottoms damaged by overflows and practically all corn damaged by wind. Little plowing done for wheat. Heavy winds and rain did much damage to fruit and trees.

Warsaw—The drouth the fore part of the month did great damage, but the rains of the last half did much good. Largest monthly rainfall since August 1906.

Avalon—A very favorable month. Corn crop is splendid and pastures good except for the rank growth of weeds. Honey bees doing well at present.

Grant City—The past month was favorable for threshing and all farm work, but was too dry for plowing.

Kidder—The first seven days of the past month were cloudy and rainy with high temperature. The second week was clear with moderate temperature and the month closed clear with low temperature.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., September, 1919. No. 9

GENERAL SUMMARY.

September, 1919, in Missouri, was unusually warm with a large amount of sunshine. The rainfall was deficient in most of the southern half of the State, but was amply sufficient over the northern half during the latter half of the month. There were no frosts, hail, or damaging general wind storms.

The weather was generally favorable for the maturing of late crops. It also was favorable for farm work, except rather too dry in the Southwest for satisfactory plowing and preparing the ground for wheat seeding; in other sections, however, this work made satisfactory progress. At the close of the month the bulk of the corn crop was safe from frost damage.

TEMPERATURE.

The monthly mean temperature for the State, 65 stations reporting, was 71.4°. The departure from the normal for 64 stations having 10 or more years' record was plus 2.7°. It was the warmest September since 1911. The 10th was the warmest day, with maximum readings of 100° or higher at 13 stations, and near that value at all others. The 24th to the 26th was the coolest period, though there were few days in the month much below normal values. There was no injurious frost.

PRECIPITATION.

The average precipitation for the State, as determined from the records of 81 stations, was 3.29 inches. The departure from the normal for 74 stations having 10 or more years' record was minus 0.54 inch. The first ten days were practically rainless, and there were no general showers until the 17th, and 18th. During the last ten days showers were more frequent and general. The total monthly amounts were nearly normal in the northwest and southeast sections; about 12 per cent above the normal in the northeast section, and decidedly deficient in most of the Ozarks, and southwestern counties. Some heavy to excessive local rains occurred on the 18th, 20th, 21st, 28th, and 29th. The greatest local monthly fall was 8.66 inches, at Mexico, Audrain County. Drought was prevalent in the southwestern quarter of the State.

WIND.

The prevailing winds were from the south. The total number of miles, as determined from 8 stations equipped with anemometers, was 5874 miles, or an average hourly velocity of about 8.2 miles. This is about 5 per cent greater than normal. General brisk winds prevailed on the 18th, and a strong local wind occurred at St. Louis on the 20th, and in the eastern part of Audrain County on the 28th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 regular stations with sunshine recorders reporting, was 286, or 76 per cent of the possible and about 11 per cent above normal.

MISCELLANEOUS PHENOMENA.

Halos, solar—15th, 16th, and 19th; lunar—16th. Thunderstorms—10th, 11th, 16th, 17th, 18th, 19th, 20th, 21st, and 28th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R.F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for September, 1919.

*Observations taken at 7.45 a.m., Summer Time. †Observations taken at 5.30 p.m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon.

OBSERVERS' REMARKS.

Fulton—The entire month was exceptionally warm.

Gorin—A warm month; during the last decade there was ample moisture.

Macon—The bulk of corn is safe in this section and corn cutting is in progress. Silos are being filled rapidly and fall plowing is in progress. The ground is in good shape for plowing. The rains are helping meadows.

Mexico—There was a small storm in the east end of the county at 6:30 p. m. on the 10th; barns and trees were blown down.

St. Catharine—September was a good month for maturing and harvesting corn. Some wheat has been sown; meadows are looking good and the ground is in fair condition.

Warrenton—A month of fine weather. Wheat sowing in progress; pastures are improving. Apples and pears are dropping.

Caruthersville—The month was favorable for crops; unusually warm for this season of the year.

Farmington—The dry weather of the first half of the month injured corn, millet and sorghum; but fine rains began with the 18th and put the soil in fine condition for fall seeding.

Houston—We have had very little frost and the weather has been fine. Some wheat sowing in progress.

Lamonte—Seventy five per cent of the wheat has been sown but the acreage is small and the condition of the seed bed is poor. Fruit is plentiful and of fair quality. Pastures are excellent and stock is in good condition.

Warsaw—The first half of the month was clear and beautiful and fine for farmers. Rains began on the 17th to the 21st. No frosts, and farm work progressing rapidly with seeding and plowing advanced.

Avalon—The month was ideal for farmers. Corn is about all matured in the bottoms where it was overflowed and replanted and in ten more days it will be safe from frost. Corn crop is good.

Grant City—The past month was favorable for farm work; much fall plowing is being done and some wheat is sown. Most silos are filled.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.
GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., October, 1919. No. 10.

GENERAL SUMMARY.

October, 1919, in Missouri, was mild and wet, except in the northwestern section, where it was drier and somewhat colder than normal. There were more rainy days and less sunshine than usual. There was no general hard freeze, but temperatures approximating the freezing value occurred at most stations in the northern and western sections on the 17th and 18th, and again on the 28th and 29th. Vegetation was generally matured and no damage was done.

There were no windstorms, but excessive rains caused floods in the lower watersheds of the Osage, Gasconade and Meramec rivers. Corn in shock was carried away, and newly-seeded wheat fields inundated. General traffic and business suffered considerably.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 58.4°. The departure from the normal for 65 stations having 10 or more years' record was +1.4°. The northwestern plateau was somewhat colder than normal, but all other sections were warmer than normal, the temperature excess in the southeastern lowlands being quite marked, averaging about 6°. The first two days were the warmest generally, with 25 stations reporting 90° or higher. The 17th and 18th were the coldest days south of the Missouri River, and the 28th and 29th were the coldest in the northern half of the State. The temperature was 32° or lower at 45 stations, but killing frost was not general in all parts of the State, there being about 20 stations along the eastern border south of the Missouri River with no killing frosts.

PRECIPITATION.

The average precipitation for the State, 82 stations reporting, was 6.74 inches. The departure from the normal for 75 stations having 10 or more years' record was +3.93 inches. It was, with but one exception (1883), the wettest October during the past 50 years. The precipitation was excessive in all sections of the State, except the northwestern plateau, and at a few stations in the northeast plain. About 15 stations, mostly in the Ozarks, received from 11.50 to over 14 inches during the month, and about 27 others—in the Ozarks, southeastern, and central-eastern counties—had monthly totals of from about 7 to over 9 inches. Excessive falls occurred on the 26–27th, 28th, and 31st, the 24-hour amounts ranging from 2.50 inches to nearly 5 inches; at Rolla, Phelps County, 9.25 inches fell within a 36-hour period. The lower lands of the Osage, Gasconade and Meramec rivers, were flooded, and considerable damage was done.

There was no snow during the month.

WIND.

The prevailing winds were from the south. The average monthly wind movement, 8 stations equipped with anemometers reporting, was 6,200 miles, or an hourly velocity of about 8.3 miles. This is about the normal for October. There were no damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 7 well-placed stations, was 157. This is only 45 per cent of the possible, and about 20 per cent below the normal for October.

DATES OF MISCELLANEOUS PHENOMENA.

Aurora.—At two stations, on the 1st. *Fogs, dense.*—5th, 6th, 7th, 12th, 14th, 16th, 17th, 20th, 21st, 22d, 23d, and 29th. *Frosts, light.*—11th, 13th, 18th, 21st; Heavy—11th, 12th, 17th, 18th, 28th; Killing—in northern and western sections on 28th and 29th. *Halos, solar.*—7th, 8th, 9th, 12th, 16th, 20th, 21st, and 28th; Lunar—4th, 7th, 9th, 11th, 17th. *Thunderstorms.*—4th, 8th, 9th, 10th, 15th, 20th, 23d, 24th, 25th, 26th, 30th, 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries. ‡‡ Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for October, 1919.

*Observations taken at 7.45 a. m., Summer Time. †Observations taken at 5.30 p. m., Summer Time. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon. ††—.018

OBSERVERS' REMARKS.

Fayette—Killing frost occurred on the 29th, but did little or no damage.

Fulton—An unusual amount of rain fell from the 26th to the 28th, inclusive.

Gorin—The month was mild and favorable.

Kirksville—A fine October, with good weather, good crops, and good roads.

Macon—On the 10th the ground was dry for fall plowing and the wheat sowing is less than last year. Killing frost on the 17th did damage to garden truck and tender vegetation only. Corn is all cut and shocked, and it is well matured.

St. Catherine—On the 1st there was a great display of northern lights. The latter part of the month was cloudy most of the time and several showers occurred, but there was not much rain.

St. Louis University—The total precipitation for this month was the greatest ever recorded for October in St. Louis.

Warrenton—The greatest rainfall for October on my record, except October, 1905, when it recorded 8.74 inches. No frost and yet the leaves have ripened with beautiful colors and are falling.

Caruthersville—Month unusually rainy and warm and very unfavorable for picking cotton and planting wheat. Corn and cotton are damaged in the fields.

Doniphan—No wheat planted, except a few small patches, because of too much rain.

Arcadia—Aurora Borealis visible between 8.45 and 10 p. m. on the 1st.

Aurora—Beginning the night of the 25th rain fell almost contınously until 11.30 a. m. on the 28th. The rain of the 31st did considerable damage to roads and farms.

Farmington—As there was so much rain and cloudy weather there has not been much of the usual October weather. The forests are in full foliage and most of it is green.

Gano—No killing frost here. There has been 7.53 inches of rain in the last six days, but no material damage has been done. Wheat is not all sown.

Houston—This has been a very unfavorable month and the ground is so wet that the farmers cannot get their wheat sown. Pastures are good.

Lebanon—Frost was reported in several parts of the county on the 17th, 18th and 29th, but no damage done.

Lockwood—Heavy rainfall this month caused delay in fall seeding and the wheat acreage will be small. Pastures are coming out green.

Rolla—Light frost on the 18th, but no damage done. Rainfall 9.25 inches in 36 hours on the 26–27th.

Harrisonville—The 1st and 2d were windy and there was killing frost on the 17–18th.

Lamonte—The ground is thoroughly soaked. Corn gathering begun on small scale, but held up now on account of muddy fields. Wheat looks well and pastures are fine. Live stock in very good condition.

Warrensburg—Cloudy, windy weather prevented heavy frost on the 16th.

Warsaw—The first part of the month was ideal; the last 10 days were extremely wet. Rainfall was more than any October on record, causing flood stage of 28.5 feet, doing great damage.

Avalon—Very favorable during the past month for farmers. Pastures are good and live stock is in good condition.

Kidder—The first ten days of the past month were warm and dry, but low temperatures prevailed the last few days.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIII. COLUMBIA, MO., NOVEMBER, 1919. No. 11.

GENERAL SUMMARY.

October, 1919, in Missouri, was somewhat wetter than usual, but the temperature, sunshine, and wind movement differed but little from their respective normals. Precipitation was more or less general on the 1st, 6th to the 10th, and during the last week. On the whole, the month was pleasant, and generally favorable for outdoor pursuits, except the work of shucking and cribbing corn was retarded because of soft or muddy fields during the first ten and the last five or six days. Wheat made fair growth, and the color was good. Rains of the 27th, 28th and 29th, froze as they fell, forming a thin sheet of ice, but as it soon melted no damage was done to wheat.

TEMPERATURE.

The monthly mean temperature for the State, 65 stations reporting, was 42.2°. The departure from the normal for 62 stations having 10 or more years' record was —2.2°. The western half of the State was slightly colder than the eastern half, and the southeastern lowlands experienced about normal temperature. Mild and cold periods alternated during the month, the longest mild period prevailing from about the 15th to the 25th; the 13th was the coldest day for the State as a whole, and the 30th the coldest in the northern and western sections, the lowest temperature being 2° above zero at Maryville. The average number of days with temperature of 32° or lower, was 17.

PRECIPITATION.

The average precipitation, as shown by the records of 71 stations, was +3.62 inches. The departure from the normal for 69 stations having 10 or more years' record was +1.40 inches. All sections received more than the normal precipitation, the most marked being in the southeastern lowlands. Five or six stations in the southwestern plain received something less than normal. The heaviest monthly amounts, varying between more than 6 to nearly 8 inches, fell in the Black River and St. Francis River watersheds. The greatest fall in any consecutive 24 hours, however, was at Aurora, in the southwestern Ozarks.

The snowfall was somewhat heavier than usual, but was confined mostly to the northern half of the State.

WIND.

The prevailing winds were from the northwest. The average monthly wind movement, 8 stations equipped with anemometers reporting, was 7,592 miles, or an average hourly velocity of 10.6 miles. This is about 5 per cent above the normal. Strong winds occurred on the 10th and 29th, but no material damage was reported.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well selected regular stations equipped with sunshine recorders reporting, was 170, or about 56 per cent of the possible, and about 1 per cent greater than normal.

DATES OF MISCELLANEOUS PHENOMENA.

Frost, killing (first of season).—For southern Ozark slope, 2d; southeastern lowlands, 13th; St. Louis City, 5th.

Halos, solar.—3d, 16th, 17th, 23d, and 24th.

Halos, lunar.—3d and 5th.

Fog, dense.—6th, 28th and 29th.

Sleet and Glaze.—27th, 28th, and 29th.

Thunderstorms.—On the 6th; thunder heard 1st, 9th, 24th, 25th, 28th, and 29th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for November, 1919.

*Observations taken at 6.45 a.m. †Observations taken at 5.00 p.m. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind, comparing favorably with sea horizon. ‡ Pan frozen, amounts estimated.

OBSERVERS' REMARKS.

Brunswick—Strong winds on the 10th.

Clifton Hill—First snow of the season was on the 27th and measured one-fourth inch.

Fayette—November was a very disagreeable month with two-thirds of the days cloudy.

Gorin—Two days of high wind, but no damage of importance. Month ended cold.

Kirksville—A violent and erratic wind on the 10th caused some damage.

Macon—First snow of the season on the 27th.

St. Catherine—High winds on the 10th blew down some corn. Snowstorm and high winds on the 29th. The month was excellent for shucking corn and most of the corn has been harvested.

Unionville—Very high northwest wind on the 10th. First snow on the morning of the 27th. There was rain, snow and sleet on the 28th, and the month ended with rain, snow and sleet and high northwest wind.

Warrenton—Some nice fall weather and late seeding done. Pastures are good, but the roads are in poor condition due to so much rain.

Farmington—The month, as a whole, was more pleasant than October as there was more sunshine, but it was cold and very remarkable in that there was no snow or sleet.

Doniphan—Excessive rain greatly hindered wheat sowing and not over 60 per cent of the normal acreage has been planted.

Lockwood—November has been a very pleasant month. Corn husking and fall plowing are well advanced. Stock are doing well and there is ample moisture for wheat.

Amoret—The wheat crop was not all sown by the end of the month.

Harrisonville—First snow of the season fell on the 28th. On the 29th rain fell and froze, forming a coat of ice on everything.

LaMonte—Partial eclipse of the sun on the 22d. Snow flurries on the 29th and sleet on the 27th.

Avalon—The past month has been very favorable for gathering corn, and corn is in good, dry condition.

Kidder—Low temperature prevailed during the entire month. The month ended clear and cold with one-half inch of sleet on the ground.

Liberty—On the 28th there was a drizzling rain that froze and formed a coat of ice on everything.

Maryville—High winds on the 3d, 10th, 11th, and 25th.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIII. Columbia, Mo., December, 1919. No. 12.

GENERAL SUMMARY.

The outstanding features of December, 1919, in Missouri, were scanty precipitation, excessive cloudiness, and persistent cold, although rather free from sudden severe temperature changes.

There was much mist and fog from about the 19th to the 24th, and during much of this time trees and other objects were thickly covered with glazed frost, the whole appearance impressing one as if living in a beautiful crystal world. Damage was confined to a few telephone and telegraph wires, and scattered breakage of small trees and limbs.

The weather was too cold for much outdoor work, though considerable corn was husked and cribbed. The roads most of the time were in fine shape for traffic in general. The wheat crop made little or no growth, but otherwise was in fair condition. Much thick ice of fine quality was housed on the more northern farms.

TEMPERATURE.

The monthly mean for the State, as shown by the records of 65 stations, was 28.5°, or 4.5° below normal, and 11.5° colder than the same month in 1918. The temperature was almost continuously below the average until the last week, when there was quite a marked change to milder weather, the 29th and 30th being the mildest days of the month. The second week was the coldest period, when the temperature deficiency averaged about 15° a day. The lowest temperatures, however, occurred on the morning of the 10th, when about two-thirds of the stations in the northern and western portions of the State reported zero readings, —22°, at Tarkio, Atchison County, being the minimum; the average was about —8° for the northern section; 0° to —4° in the central, and 0° to 1° above zero in the southern counties. Temperatures of 32° or lower occurred on 29 days at 30 or more stations, which is quite unusual. The northern half of the State averaged about 4° colder, and the southwestern plain more than 2° colder than the Ozark Plateau.

PRECIPITATION.

The average precipitation for the State, as determined from the records of 79 stations, was 0.59 inch. The departure from the normal for69 stations having 10 or more years' record was —1.50 inches. The month was about the second driest of its name since 1876, and was in marked contrast to December, 1918. Precipitation was general only on about three days during the first ten and one day during the last ten days; most of the precipitation was light snow, or rain that froze as it fell. The deficiency was uniform in all divisions, but a local exception might be made at Caruthersville, in the extreme southeast, where the monthly total was 4.30 inches, 2.65 inches of this amount falling on the 13th.

WIND.

The prevailing winds were from the northwest. The average monthly wind movement was 7,267 miles, or an average hourly velocity of 9.8 miles. This is about normal for December. There were no strong winds.

SUNSHINE AND CLOUDINESS.

There was more cloudiness than usual. The average number of hours of sunshine, for the State as a whole, was 121. This is about 41 per cent of the possible, and 7 per cent below normal.

DATES OF MISCELLANEOUS PHENOMENA.

Fogs, dense.—4th, 6th, 19th, 20th, 21st, 22d, 23d and 24th.
Halos, solar.—3d, 9th and 16th. Lunar—3d and 7th.
Sleet.—5th, 8th, 9th and 13th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries. ‡‡ Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for December, 1919.

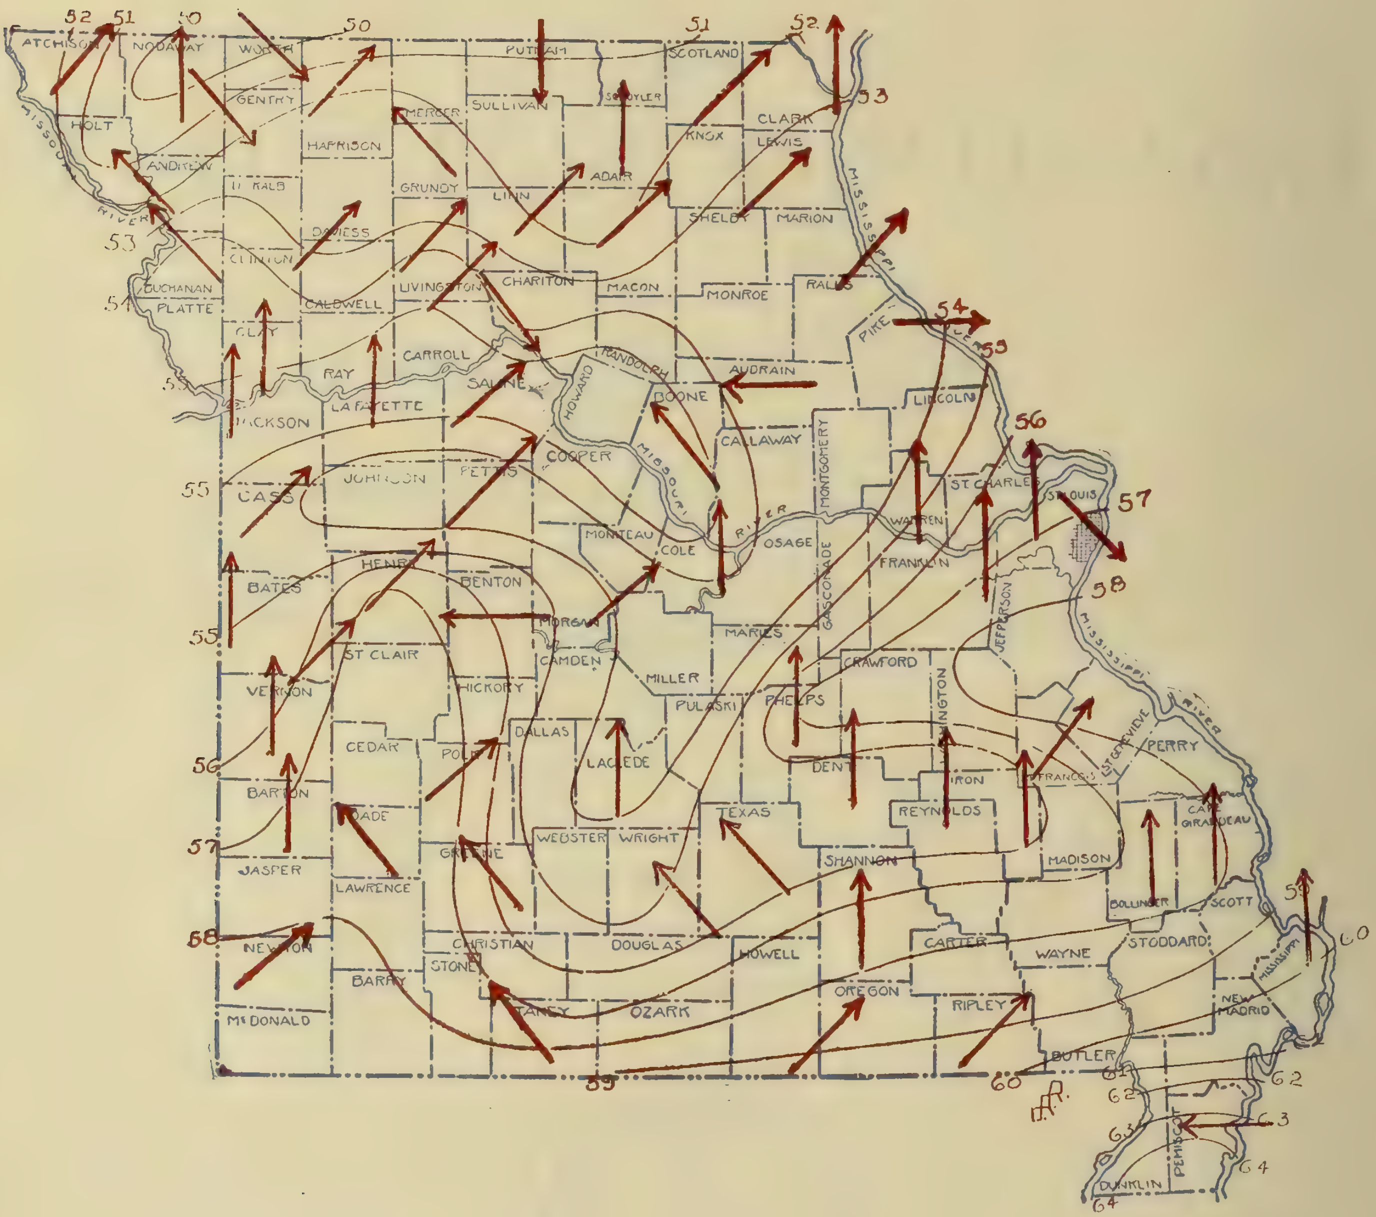
MEAN TEMPERATURES AND PREVAILING WINDS FOR YEAR 1919.



U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIII. COLUMBIA, MO., YEAR, 1919. No. 13.

GENERAL SUMMARY.

The year 1919, in Missouri, was not characterized by any marked weather extremes, save relatively dry conditions in July generally, and rather persistent drouth over most of the southern half of the State during August and most of September.

The winter and spring were favorable for outdoor work, so much so that by the end of March all farm work was well ahead of what it usually is at this time of year. Wheat made rank growth during the winter and spring, but the month of May was rather too wet for an exceptional yield.

There were no great river floods, but the Missouri River tributaries were temporarily out of banks in a few places during March, April, June and October, and excessive local rains in Jackson, Johnson, Cass and Pettis counties during the last week of August put the Blackwater River out of banks for a day or two.

There were a few local hailstorms during the spring and early summer months, but there were no severe storms of any kind. An unusually wet October interfered somewhat with autumn plowing and seeding, but, on the other hand, the excess moisture made excellent winter pasturage.

The growing season continued well into the latter part of October for most of the State, and into November for the southern and eastern Ozark slopes. With the last few days of November the winter of 1919-20 set in—somewhat earlier than usual—and quite steady cold continued practically throughout December. A brief synopsis of principal data follows:

TEMPERATURE.

The annual mean for the State was 55.2°, or about 0.8° above normal. The highest temperature was 106°, at Caruthersville on August 6, and the lowest was −23°, at Maryville on January 3. January, February and March were milder than usual, and June, July, September and October were warmer than normal; May was cooler, while August, especially the latter part, was quite pleasant, averaging about normal warmth; the last part of November and all of December was unusually cold.

The prevailing winds and mean temperatures are graphically shown on page 98.

PRECIPITATION.

The annual precipitation for the State was 40.05 inches, or about 0.83 inch greater than the average. The greatest monthly amount was 14.87 inches, in October at Rolla; eight stations during January received no appreciable precipitation. The first three months of the year were drier than the average, January being the driest of its name since 1866. May was the first month to give surplus moisture; June, the last half of August, October and November were wetter than normal; July and the first ten days of August were drier than usual; September exceeded its normal by about one-half inch; December was exceptionally dry.

The seasonal snowfall ranged from about 2 inches in the southeastern lowlands to 16 inches in the northwestern plateau; the heaviest snows fell in February.

The total precipitation (rainfall and melted snow) for the year is graphically shown on page 107.

THE WEATHER BY MONTHS.

January.—The first week was moist and very cold, but after about the 10th the weather was generally favorable for outdoor pursuits, and remarkably pleasant from the side of personal comfort. The soil was in excellent condition, and considerable plowing was done during the latter part of the month. The wheat crop was rated good to excellent. Livestock was in fine winter condition, the well-grown wheat and rye fields affording good pasturage. All public roads were in good condition and traffic was heavy.

February.—Except somewhat cold, snowy and blustery weather on the 8th, 9th and 28th, the month was mild and favorable for outdoor work most of the time. There were no severe temperature changes, and the moisture and sunshine were sufficient for needs. Considerable plowing was done. The wheat crop was in fine condition and livestock was in good shape.

March.—The first day was the coldest, with zero temperature at a few stations, but the month was, as a rule, mild in all sections of the State, and favorable for outdoor pursuits. The month was unusually free from that blustery weather commonly associated with March, though there were a few local storms. There was some local flood damage in the lowlands of the Grand, Platte and Nodaway rivers, caused principally by waters coming from the upper watersheds. The wheat crop was in excellent condition. Oats sowing was nearly completed. The fruit outlook was fair.

April.—There were no unusual features, the meteorological elements differing but little from their normal values. There was some local wind damage in Butler County on the 23d, and local hailstorms caused some damage in Buchanan, Boone and Butler counties, widely separated points, on the 21st, 23d and 29th. The northern tributaries of the Missouri River overflowed some of the lower lands. Freezing or near freezing temperatures were general on the morning of the 26th, but damage was confined to localities in the northeast plain, and in the valleys and other low places in the Ozark Plateau. Farm work was delayed in the northwest plateau by wet soil, but elsewhere farm conditions were generally satisfactory.

May.—This was the first month of the year to supply surplus moisture to the soil, and also the first with temperature less than normal. As a whole the month was cool, cloudy and wet, though there were only a few days on which the sun did not shine. There were a few local storms, the damage being confined to small areas. Farm work was delayed during the latter part of the month, when rain fell almost daily. There was rather too much rain for wheat; the first hay crop also was damaged. About one-half the number of stations had rain on 15 days, and a few as many as 20 days.

June.—This month, as a whole, was uniformly warmer than normal. In some respects it was a rainy month; it was excessively wet in some localities, moderately so in others, and relatively dry in a few. Most of the Missouri River tributaries were out of banks during the first 10 days, but the Missouri itself remained within banks. A few local wind and hailstorms occurred. There was rather too much rain, as a rule, for best wheat yields, and some corn in the bottoms was abandoned because of rank weed growth. Pastures and meadows were highly satisfactory.

July.—The weather was characterized by a large amount of sunshine, insufficient moisture over the eastern and southern sections, and a general excess in temperature, though the last element was not markedly unusual. The general conditions were largely a repetition of those that prevailed during the three past Julys. There were a few hail and windstorms, but the resulting damage was confined to small areas. July is the critical month for the corn crop. For best results it should have frequent and well distributed rains. At the close of the month much upland corn was suffering, and a small per cent in the eastern and southern sections was nearly a failure. Harvesting, threshing and haying made good progress. Pastures in many districts were brown and scanty. A few stockmen had to feed, but as a rule livestock did very well. At the close of the month drouth obtained generally.

August.—The first half of the month averaged warmer than normal, while the latter half was cooler than normal. Excessive heat obtained only during the first week, and, as a rule, the month was a pleasant one from the physiological side. The weather was not altogether favorable for crops. The rainfall was unevenly distributed and fell at irregular intervals, the intervals between good rains being rather too long for best results. An unusual rainstorm occurred in a few of the central-west counties, south of the Missouri River, on the 27th, 28th and 29th. Amounts, ranging from 5 to over 11 inches, fell within twenty-four hour periods. The Blackwater River went out of banks, and only the prevailing dry condition of the soil prevented heavy damages in some localities.

September.—The month was warm, with a large amount of sunshine. The rainfall was deficient in most of the southern half of the State, but ample over the northern half during the latter half of the month. There were no frosts, hail or windstorms. The weather was favorable for maturing crops; it also was favorable for farm work, except rather too dry in the southwest for satisfactory plowing and preparing soil for wheat seeding; in other sections, however, this work made good progress.

October.—The weather of the month was warm and wet, except in the northwestern section, where it was drier and somewhat colder than normal. There was more cloudiness than usual for October, and the so-called Indian Summer weather was absent. There was no general hard freeze, but temperatures approximating the freezing value occurred at most stations in the northern and western sections on the 17th and 18th, and again on the 28th and 29th. Vegetation was generally matured and no damage was done. Excessive rains caused floods in the lower watersheds of the Osage, Gasconade and Meramec rivers. Corn in shock was carried away and newly-sown wheat fields were inundated. Local traffic and business suffered somewhat.

November.—The month was somewhat wetter than normal, but the other meteorological elements differed but slightly from their respective normals. On the whole the month was pleasant and generally favorable for outdoor work, except the fields were too muddy for hauling out corn, especially during the first ten and last five or six days. Wheat made a fair start. The snowfall was confined to the northern half of the State and exceeded the average a few inches.

December.—This month was characterized by scanty precipitation, excessive cloudiness and persistent cold, although without sudden severe temperature changes. There was much mist and fog from about the 19th to the 24th, and during much of this time all outdoor objects were thickly covered with a glazed frost, the whole presenting an enchanting view. Damage was confined to a few telegraph and telephone wires and poles and limbs of trees. The weather was too cold for much outdoor work. The public roads were in fine shape for traffic in general.

DESCRIPTION OF EVAPORATION STATIONS.

The University of Missouri, Columbia, Boone County, is situated in latitude N. 38° 57', longitude W. 92° 20'; elevation, 737.5 feet above sea level.

For convenience and to prevent confusion of records the two evaporation stations at this place have been named "Columbia" and "University of Missouri," as both are located on University grounds. "Columbia" is located on the West Campus, about 180 feet northwest of Switzler Hall, in which is located the Weather Bureau office, while the other station is about one mile southeast on the Experiment Farm, in the southeast quarter of an open experimental crop field, where the exposure compares favorably with sea horizon. The exposure of the station on the West Campus is not so good, the pan being shaded in summer by reason of trees and buildings, as compared with sea horizon, about two hours in the morning and evening; and the free movements of the winds also are much interfered with, the "University" station experiencing about 100 per cent more wind. The different exposures afford an excellent comparison as to the effect of wind upon evaporation, this value being about 18 per cent greater at the freer exposed station.

Observations began at "Columbia" on April 1, 1916, and at "University of Missouri" on May 1, 1916. Observations are taken daily, at 6.45 a. m. at the former, and 5.30 p. m., 90th meridian time, at the latter station. The equipment is the same in both cases, that is, the evaporation pans are cylindrical, made of 22 B. W. G. iron, 48 inches in diameter, 10 inches deep, and are filled to the approximate depths of 8 inches. The pans rest upon wooden supports and there is good ventilation under them. The rain guage at "Columbia" is the 12-inch TB pattern, while the regular 8-inch pattern is placed at the other station. Both stations have the Robinson anemometer, the instruments being so placed that the cups are 6 inches above the rim of the pan. Temperature records are made only at the West Campus station, the thermometer shelter being about 100 feet east-southeast from the pan, the bottom of the shelter 11 feet above ground; the regular maximum and minimum thermometers are used; also the following additional instruments: thermograph, barograph, hygrograph, and meteorograph. At the "Columbia" station the ground in the immediate vicinity of the pan slopes to the north, average 5 per cent grade; at the "University" station the ground has about the same average grade to the south; at the former station the soil is covered with blue grass sod, while at the latter the soil is cultivated. There are no bodies of water near either station, nor are there any irrigation projects under way nearby. The general topography is rolling, with patches of forest trees.

The U. S. Weather Bureau is in charge of the work, the supervising official being George Reeder, Meteorologist and Section Director.

SUMMARY OF STORM DAMAGE FOR THE YEAR 1919.

March 14-15—Period of severe thunderstorms and excessive rain over northern sections. Caused floods in Grand, Platte and Nodaway rivers; reported damage..............$10,000

March 15—Three tornadoes in the afternoon, one in Vernon, one in St. Clair and Henry, and one in Maryville, Nodaway County. Details of the last mentioned tornado have never been published and are entered here for reference. Occurred in northern part of the town at 1:30 p. m. There was a well-defined funnel cloud; it traveled from the southwest; passed through a grove of small pines on the campus of the Normal College, leaving a path of wreckage 50 feet wide. It then touched the west corner of the auditorium, at the north side of the main building. Only the corner masonry was torn away, but the huge trussed roof of the assembly room was twisted out of shape and then dropped on the walls again. At the instant the roof was lifted the great oaken doors leading from the corridor were sucked into the room, frames and all, leaving the ragged masonry at the sides. Other doors leading from the corridor to the different class rooms were sucked into the corridors, and 50 window panes, each four feet square, were sucked into the class rooms. Glass in windows and doors were all sucked towards the corridors and down the corridors towards the assembly room. All this happened in an instant. All the skylights were sucked into the rooms. Several doors were torn away, frames and all, though only the glass was broken from glass doors. One other building was unroofed; estimated damage..$23,000

April 21—Buchanan County was visited by severe hailstorm from Halls to Gower. The path was one to three miles wide and 35 miles long. Damage chiefly to wheat, first crop alfalfa and orchards................................$45,000

April 23—Butler and Stoddard counties, from Fisk to Marco. Damage to wheat, alfalfa, gardens and fruit. One church unroofed.......................................$12,000

April 29—Boone and Callaway counties—the most destructive hailstorm in years at spots from Midway to Stephens. Damage chiefly to crops and fruit trees....................$25,000

May 15—Randolph County, near Moberly. Damage to crops...$3,000

May 15—St. Clair County, near Appleton City. Damaged roofs, glass, hay and grain crops; estimated damage....$9,000

May 17—Small tornado in northwest Harrison Co....$1,000

June 3-4—Floods in Current River; damage to wheat.$24,000

June 8—Several local severe hailstorms in Mississippi County and other southeastern counties; great damage to wheat.$100,000

June 17—St. Louis County, and City of St. Louis, scene of severe thunderstorms. Lightning caused several fires, public service properties, awnings and plate glass were damaged. Damage to crops in the county. Two persons killed by lightning..$14,000

June 19—Local thunderstorms in northern sections..$65,000

June 25-26—Local storms and high winds in northwest portion of the State; lodged much wheat in Jackson, Clay, Platte, Clinton, DeKalb and other counties; often 15 to 30 per cent loss..$125,000

July 11—Boone, Audrian and Callaway counties. High winds over portions of this area did great damage to buildings, barns, silos, windmills, trees and crops..................$175,000

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.
GEORGE REEDER, Meteorologist.

Vol. XXIV. Columbia, Mo., January, 1920. No. 1.

GENERAL SUMMARY.

In Missouri the meteorological elements during January, 1920, did not differ materially from their respective normal values. There were no severe cold or unusually mild periods, and, because of the uniformly low temperatures, with light precipitation and a good many bright days, the month was pleasant for mid-winter. There were several days with sleet or glaze during the first and last decades, but, except a few minor accidents to pedestrians, and temporary interruptions to the general wire service, no hardships resulted. From the physiological side probably the gloomiest days were from about the 5th to the 8th, and 22d to 24th, when rather dense cloudiness prevailed.

The winter wheat crop made little or no growth; north of the Missouri River its condition was about the average for January, but in southern sections the crop was poor and thin generally.

TEMPERATURE.

The monthly mean temperature for the State, 66 stations reporting, was 28.6°. The mean departure from the normal for 64 stations having 10 or more years' record was minus 1.4°. The temperature deficiency averaged about 1.7° in the Ozark Plateau, and 2.7° in the northeastern plain, but elsewhere the departures from normal were unimportant. There were no severe cold waves; zero conditions occurred at only 4 stations in the northeastern plain, at 1 in the southwestern plain, and at 5 stations in the northwestern plateau, generally on one day, the 25th, though some stations reported zero readings also on the 3d and 10th. The minimum was −5°, and occurred at three stations, Bethany, Unionville and Louisiana.

PRECIPITATION.

The average monthly precipitation, 82 stations reporting, was 1.57 inches. The departure from the normal for 74 stations having 10 or more years' record was minus 0.65 inch. Precipitation was slightly in excess of the normal along the southern Ozark slope, and in the southeastern lowlands, but in all other sections it was below normal, the deficiency being marked in the northeastern plain. Precipitation was more or less general over the eastern half of the State on the 2d, 6th to 9th, and 23d, and in the southeast 20th to 23d; and 5th to 9th, and 21st to 24th over the western half. There was much general cloudiness during the first and last ten days. There was general snow, though without high wind, on the 8-9th. There was some sleet damage on the 6-7th, and glaze was general on the 22-23d. Snow and glaze covered the northern portion of the State until about the 15th, and along the northern border much later. The ice layer of the 22-23d continued for several days, save in the more southern counties.

WIND.

The prevailing winds were from the north. The total number of miles, 8 stations equipped with anemometers reporting was 7402, or an average hourly movement of 10.0 miles. There were no strong winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations with sunshine recorders reporting, was 176, or 57 per cent of the possible, and about 6 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—6th, 7th, 12th, 15th, 16th, 20th, 23d, 29th, and 30th.

Halos, solar.—10th, 20th, 25th, and 26th. *Lunar*—5th, 10th, and 26th.

Sleet.—5th, 6th, 7th, 8th, 20th, 21st, 22d, and 23d.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for January, 1920.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIV. COLUMBIA, MO., FEBRUARY, 1920 No. 2.

GENERAL SUMMARY.

Except a short cold spell about the middle of the month, and raw and chilly weather during the last week, February, 1920, in Missouri, was somewhat milder than the average. The precipitation was markedly less than the normal amount, but there were more misty and foggy days than usual.

There was considerable alternate freezing and thawing, which proved unfavorable for the wheat crop; and, notwithstanding the scanty precipitation, there was, as a rule, too much soil moisture for the proper preparation of the ground for sowing oats, and consequently that part of farm work will be delayed.

There were no damaging wind or sleet storms.

TEMPERATURE.

The monthly mean temperature, 65 stations reporting, was 34.5°. Along the extreme southern border the temperature averaged about 40°, a plus departure of 4.4°; along the northern border the average was slightly below 30°, a plus departure of 4.8°; for the State as a whole the plus departure was 3.2°. The weather was mild from the 1st to 13th, and 17th to the 23d, the warmest days being the 2d and 20th, with day temperatures ranging from 68° to 78°; the coldest periods embraced the 14th, 15th, and 16th, and the last 6 days of the month; the coldest day was the 16th when zero or lower occurred at 24 stations, the minimum being —5°, along the northern border. There were only about 5 or 6 days of typical winter weather, that is, days on which the maximum did not rise above 32°. The average number of days with minimum temperature of 32° or lower was 22.

PRECIPITATION.

The average precipitation, 81 stations reporting, was 0.57 inch. The mean departure from the normal for 72 stations having 10 or more years' record was minus 1.68 inches. The deficiency was uniform in all divisions, but, on the other hand, precipitation was quite frequent in both the first and last decade, though generally light. The snowfall was of little importance, the monthly average being 1.2 inches as compared with 7 inches as the normal. There were a few local heavy falls along the Southern Ozark slope, on the 14th, and 26th.

WIND.

The prevailing winds were from the northwest. The average wind movement, based upon 8 stations equipped with anemometers, was 7,128 miles, 10.2 miles an hour, and about 2 per cent less than normal. There were no strong or damaging winds.

SUNSHINE AND CLOUDINESS.

The higher clouds prevailed, resulting in partly overcast skies. The number of hours of sunshine, based upon the records of 5 well distributed stations, was 148. This is about 47 per cent of the possible amount and about 4 per cent less than the normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—1st, 3rd, 5th, 6th, and 21st.

Halos, solar.—1st, 2d, 9th, 12th, 13th, 15th, 18th, 20th, and 28th. *Lunar*—1st, 2d, and 3d.

Sleet.—5th, and 28d.

Thunder heard on the 21st, and 22d.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for February, 1920.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. ‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. T. Trace, or less than 0.01 inch. ** Regular Weather Bureau station; precipitation is for 24-hour period, midnight to midnight. ** Precipitation in the next following measurement. ‡ Separates dates of fall not recorded

Daily temperatures for February, 1920.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIV. COLUMBIA, MO., MARCH, 1920 No. 3.

GENERAL SUMMARY.

March is the transition period from winter to spring. It is the time of sudden change and bluster, winter one day and spring the next, of lengthening days, and of starting life after the sleep of winter. March, 1920, in Missouri was quite typical. Though the month, for the State as a whole, averaged warmer than normal, the cold spell along about the 7th proved nearly a record breaker for so late in the month. While there were no unusually warm days there were about 20 days with normal or above normal temperatures.

High winds were the feature of this March. On about six to ten days velocities of 35 miles an hour or higher occurred, and on two days, the 25th, and 28th, winds of 50 to 60 miles an hour, and even to 70 miles for a few minutes at a time, caused quite widespread damage to trees, houses and other property; and the telegraph and telephone services were seriously handicapped and required several days to get back to normal working conditions. For a more detailed report on storms see page 24.

The prevailing condition of the ground was wet and cold, and taken together with high winds the month was unfavorable for farm work and vegetation, and also it was generally disagreeable from the side of personal comfort.

TEMPERATURE.

The monthly mean temperature, based upon reports of 68 stations, was 44.6°. The mean departure from the normal for 65 stations having 10 or more years' record was plus 1.4°. The southwestern, and northeast plains, and the northwest plateau averaged about 2° warmer than normal, while the Ozark Plateau and southeastern lowlands were cooler than normal. From about the 4th to the 8th was the coldest period, the 7th being the coldest day when minimum temperatures were around zero or lower at 34 stations; the last two weeks were quite mild, the 27th being the warmest day when maximum temperatures ranged between 75° to 80° generally. The average nuumber of days with temperature 32° or lower was 14, the same as during March, 1919.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, was 5.01 inches. The departure from the normal for 74 stations having 10 or more years' record was plus 2.09 inches. The precipitation was uniformly distributed, the northeast plain receiving somewhat less moisture than the other divisions. Precipitation was more or less general on two or three days during each decade; the heaviest falls occured on the 11-12th, and 24-25th, several stations receiving amounts in excess of 2 inches in twenty-four consecutive hours, the greatest being 6.00 inches at Avalon on the 24-25th.

The snowfall was about 40 per cent of the normal.

WIND.

The prevailing winds were from the southwest. The average wind movement, 8 stations equipped with anemometers reporting, was 11065 miles or 40 per cent greater than normal. Strong gales to severe storms prevailed on the 25th, and 28th; and strong winds of 35 miles an hour and over prevailed on from 6 to 10 other days. It was the windiest March on record. (For a more detailed report on storms see page 24.)

SUNSHINE AND CLOUDINESS.

There were 15 clear days, 6 partly cloudy, and 10 cloudy days. The average number of hours of sunshine, 6 well selected stations reporting, was 228, 62 per cent of the possible, and 7 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense—10th, and 11th.

Halos, solar—1st, 2d, 4th, 5th, 6th, 13th, 14th, 17th, 22d, 27th, and 31st. *Lunar*—1st, 2d 4th, 5th, 7th, 11th, 16th, 25th. 28th, and 31st.

Hail—18th. *Sleet*—4th 16th, and 19th.

Thunderstorms—11th, 15th, 18th, 23d, 24th, 25th, 27th, 28th, and 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for March, 1920.

OBSERVERS' REMARKS—MARCH.

Brunswick—Strong wind on the 12th, 15th, 19th and 28th.

Fayette—Strong winds on the 25th did a great deal of damage throughout the county. Strong winds on the 28th also, but not much damage done.

Fulton—Extremely variable winds.

Kirksville—There was 5.08 inches of rainfall from 8:30 a. m. of the 24th to 4:30 p. m. of the 25th.

Macon—Rain turned to snow on the 3d. Light blizzard with high wind on 6th. Hail, but no damage, on the 18th. Windstorm did much local damage on 28th. Wheat good and oat sowing in progress.

Mexico—Very high wind on the 25th and 28th, blowing down trees, signs and guttering,

St. Catherine—On the 25th and 26th creek overflowed the bottoms. Highest since 1875, old residents say. Very windy month. Grass and wheat look well.

Unionville—Blizzard on the 4th, with high north wind and snow.

Warrenton—A very windy month. Vegetation late. Fine prospects for a good fruit crop.

Aurora—Exceptionally favorable for truck gardeners and for fruit. Farmers are rushing plowing.

Bolivar—Month remarkable for extremes of temperature and very high winds the last ten days.

Eldon—High wind on the 6th drifted the snow. A gale on the 25th blew down outhouses and small barns and sheds.

Farmington—Much damage done by the storm of the 28th. The first half of the month was cold and the latter half windy and wet. Impossible to plow until the last few days.

Gano—Some damage done to house tops and hay stacks by the hard wind of the 28th. Wheat is improving some.

Houston—March was a record-breaker for high winds. Farmers unable to plow because of so much rain and lots of oats are not yet sown.

Lebanon—The worst March we ever had for high winds.

Lockwood—High winds on the 28th did some damage. All farm work delayed. Wheat only fair.

Amoret—Wheat very poor; some fields have been abandoned. Oats about all sown. Considerable plowing being done for corn. Not much clover sown on account of the high cost of seed. Grass starting good.

Appleton City—Rain of the 26th the heaviest in several years. Roads good. Wheat in poor condition.

Clinton—Heaviest rain in seven years fell from the 24th to the 26th. Hurricane wind on the 28th.

Lamonte—Wheat prospects generally poor; about 65 per cent. All fruit promises good. Seventy-five per cent of the oats are sown. No spring breaking for corn. Fifty per cent of the potato crop planted. Many buildings damaged by high wind of the 28th.

Nevada—A tornado struck Nevada at 1:10 p. m. of the 11th and destroyed $75,000 in property and killed three men.

Warsaw—Greatest rainfall for March since 1912. Fine prospects for fruit of all kinds. Wheat generally improved. Flood of the 25th did some damage.

Avalon—Very wet the latter part of the month. Grand River out of its banks and overflowed bottom lands. The prospects for peaches are good.

Edgerton—Easily the windiest month I ever observed. Wheat in poor condition the first of the month, but greatly benefitted by rains of 23d to the 26th.

Grant City—Very little spring plowing done.

Kidder—High wind during the month.

Lexington—Strong winds on several days. Heaviest March rainfall in 24 years.

Tarkio—High winds with dust storms and little rain characterized the month.

DAMAGING STORMS—MARCH, 1920.

LOCAL STORMS: On the afternoon of the 11th there were two local storms of the tornado type, one in Taney County about noon, and one at Nevada, Vernon County, about an hour later.

The Taney County storm seems to have originated in Carroll County, Arkansas, a few miles southwest of the Missouri line. Oasis was the first Missouri point in the path, and Bradleyville, in the northeastern corner of the county, 28 miles from Oasis, was the last place reporting any damage.

At Oasis the storm track was about 50 yards wide; beyond Melva it is reported to have swept over a path nearly one-half mile wide, but generally the path was less than 100 yards. The storm traveled over the 16 miles from Oasis to the White River in 20 minutes, or at 48 miles an hour.

The dwelling of John Gross, near Oasis, was the first point of damage. He and his wife were in the house when it was swept from its foundation into the air. They were found in the adjacent woods, dazed but unhurt; but only a few of the timbers of the house were to be found in the locality. From there to Melva only the tops of the Ozark ridges were touched, but in the broader valley of Turkey Creek the little settlement of Melva was demolished, ten persons were killed and ten seriously injured. Eight other persons were injured near Kirbyville and in the course of the storm towards the White River. After crossing the river the storm seems to have lifted and caused only occasional damage of a minor nature. An estimate of $150,000 to $200,000 has been placed on the property loss.

Another tornadic storm swept a path through a portion of Nevada from 1:10 p. m. to 1:15 p. m. Several valuable business buildings were demolished and many other buildings sustained considerable damage. Three young men were crushed in the wreck of one of the buildings and were dead when found. The path of the storm was narrow and less than a mile in length. The loss will reach $75,000 to $100,000.

On this date many parts of the State reported severe storms and excessive rains, but no further damage seems to have occurred.

Vanzant, a tiny hamlet twelve miles south of Mountain Grove, was the scene of a tornado at about 2:30 a. m. on the 28th. The path was about 200 yards in width and only a few miles long. Six farms were swept, on four of which the dwellings were either wrecked or damaged. Several persons narrowly escaped when their homes were struck. The loss has been estimated at $3,000.

WIND DAMAGE: The gales of the 25th and the 28th will long be remembered. While high winds prevailed throughout the State on both dates, damaging velocities seem to have been confined mostly to the central portions, with about ten counties from Pettis to Marion sustaining the greater loss. Pettis, Cooper, Moniteau, Howard, Boone, Randolph and Monroe counties had an aggregate loss of $100,000 to $110,000 on each of these days. Additional loss of from $30,000 to $50,000 has been reported from other parts of the State. The loss was greatest in the counties mentioned on the 25th, perhaps, while the wind of the 28th caused damage over more extensive territory. In a few instances temporary repairs made after the 25th were torn down by the wind of the 28th. In other instances the second wind finished the damage started by the first. In the counties mentioned nearly every farm, village and city sustained damage ranging from a few shingles or an old shed to demolished barns, unroofed houses, uprooted orchards, silos and windmills. In the towns, plate glass, greenhouses, chimneys and smokestacks, roofs, public service properties, etc., were items of large loss. Wind velocities ranged from 45 to 70 miles an hour, and perhaps even higher velocities occurred for short intervals. On the 25th the gale continued throughout the afternoon, and on the 28th the highest velocities obtained before noon, though continuing high all day.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIV. Columbia, Mo., April, 1920. No. 4.

GENERAL SUMMARY.

The heavy and general snowstorm of the 3d-4th, and following record-breaking low temperatures on the morning of the 5th, were the outstanding features of an otherwise rather unusual April. From the side of personal comfort it was a disagreeable month, being cold generally (but little warmer than the preceding month), cloudy and wet, the last being in marked evidence over the northern two-thirds of the State. Fires for bodily comfort were a constant necessity.

The season, both as to farmwork and vegetation, was much behind the general average. At the close of the month, save along the southern border, practically no plowing and very little planting had been done. The wheat crop was much under its average condition at this time. The freeze of the 5th damaged fruit in the southern portion of the State, where, of course, it was farther advanced than in the northern sections. Because of the backward condition of vegetation neither frost nor hail caused serious damage. For a more detailed report on hail and other storms see page 32.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 67 stations reporting, was 50.2°. The departure from the normal for 65 stations having 10 or more years' record was minus 4.7°. This month was about 5° colder than the same month last year, and, in fact, it was the coolest April since 1907. Unseasonably cool weather was experienced in all sections, but the temperature deficiency was not as marked in the southeastern lowlands and Ozark Plateau as in the southwestern and northeastern plains and northwestern plateau, where, in the last named especially, the month averaged more than 6° cooler than normal. North of the Ozarks there were only a few real spring-like days, namely, 1st, 15th, 21st, 22d and 29th; along the southern Ozark slope the 18th and 19th were quite warm. Decidedly cold, disagreeable weather prevailed from the 3d to the 9th, on the 12th and 13th, and 26th to the 28th. On the morning of the 5th record-breaking low temperatures for April embraced the entire State, the minimum being 4°, at Edgerton, Platte County. About 20 stations experienced temperatures ranging between 6° and 10° above zero, three of these being in the central Ozarks. The average number of days with temperature of 32° or lower was 7.

PRECIPITATION.

The average precipitation for the State, 81 stations reporting, was 3.95 inches. The departure from the normal for 73 stations having 10 or more years' record was plus 0.15 inch. Rain fell almost every day in some part of the State, but they were, as a rule, light and local from the 6th to the 10th and 21st to the 24th. The total monthly fall was something less than normal in the southeastern lowlands and Ozark Plateau, while the greatest excess occurred in the northwestern plateau.

A marked feature of the month was the snowstorm of the 3d and 4th. This was the heaviest and most general snow that has occurred in April during the past 30 years. The snow melted almost as fast as it fell along the southern border, but over the northern two-thirds of the State amounts ranged from 3 to over 15 inches on a level, and drifted to great depths, interrupting travel for several days, especially in the northeastern counties.

WIND.

The prevailing winds were from the northwest. The total number of miles, 8 stations equipped with anemometers reporting, was 9320 miles, or an average hourly movement of 12.8 miles. Quite high winds prevailed on the 22d. For a more detailed report of storms see page 32.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well-placed stations with sunshine recorders reporting, was 199, or 50 per cent of the possible, and about 11 per cent below normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense—20th and 30th. *Frost, killing*—2d, 4th, 5th, 9th, 13th, 14th and 28th. *Hail*—1st, 3d, 18th, 19th and 29th. *Halos, solar*—4th, 5th, 13th, 14th, 17th, 23d, 24th, 25th and 28th. *Lunar*—23d and 28th. *Thunderstorms*—1st, 3d, 4th, 11th, 12th, 15th, 16th, 17th, 18th, 19th, 20th, 28th, 29th and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for April, 1920.

*Observations taken at 6.45 a.m. †Observations taken at 5.30 p.m. ** Included in next following measurement. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind.

OBSERVERS' REMARKS—APRIL.

Brunswick—Hail on the 20th broke through windows and rubber roofs; depth ranged from one-half to one inch. From 2 to 4 p. m. it was so dark that lights had to be used.

Louisiana—Beginning Easter Sunday snow fell for about 30 hours, the heaviest of the season. High winds all day. If some of the snow had not melted as it fell, it would probably have measured twelve or fourteen inches.

Macon—All vegetation late; too wet for anything.

Palmyra (Sunday, April 11th)—The snow that fell on Easter Sunday is still three to five feet deep in roadways. The rock road to Hannibal remained blocked until the 9th and was broken through by army trucks. Farmers living within one mile of the city limits were unable to get to town until the 8th. Rural mail routes were abandoned all week.

St. Catherine—On the 3d it began snowing and snowed until 2 p. m. of the 4th. On the 16th, 18th and 19th the creek was over the bottoms. April has been cold and wet, with little sunshine.

Warrenton—Cool and cloudy weather prevailed during April. All vegetation backward and no plowing or planting done.

Aurora—High winds on the 18th, followed by a thunderstorm on the 19th, with hail; no extensive damage reported. Generally speaking, the weather has been fairly good.

Farmington—This has been a backward and disagreeable month, with high winds and wet, cold weather.

Houston—We have had a lot of cool, damp weather this month, but the last five days everything was growing nicely.

Lebanon—The apple blossoms seem to be about 40 per cent undamaged by the heavy frost.

Lockwood—A very cold, wet month, with strong winds. All farm work delayed. Wheat looks good, but oats are only fair; corn planting late; pastures late. Fruit damaged on the 5th.

Amoret—Freeze on the 5th killed nearly all of the stone fruit. Considerable damage to apple buds.

Lamonte—A cold, wet, backward month. But little plowing and planting done. Wheat and pastures look very well.

Warsaw—Coldest on the 5th ever known in this section so late in the year, and the worst snowstorm on the 4th for any April. Entire month too cold and wet for work or growth of vegetation.

Avalon—The month has been cold and wet and not favorable for farmers. Very little gardening done and oat sowing backward. Land too wet to plow. Fruit trees in bloom the first of May.

Grant City—The entire month was very unfavorable for farm work and but little done.

Kidder—The past month was cold and wet and there was not much farming done.

Liberty—A great deal of damage was done to fruit by the frost of the 28th.

DAMAGING STORMS.

The storm period of the 3d-5th was an unusually severe one for April in Missouri. New records for the month were set for low temperatures, and, taking the state as a whole, for heavy snowfall.

There have been heavier local snows in April, but none were so heavy over such wide area as the one of this year, for the time that observations are available. Possibly the heaviest snow for April of which there is any record, fell in 1837, according to Prof. C. W. Pritchett, observer at Glasgow, Howard County, who says:

"On April 7th, 1837, it snowed all day in St. Charles and Warren counties, and, on the level, snow lay two and one-half feet deep on the morning of the 8th."

The snow of this April began at daybreak of the 3d in the northwestern corner of the State and continued throughout the day. The 4th was clear and cold. Over most of the State, however, rain and snow fell together or alternately during the afternoon of the 3d, but snow began during the night and continued to late afternoon or night of the 4th. Some stations reported steady snowfall for thirty hours. It was attended by high winds and drifted into the roads, oftentimes several feet deep. In many localities the roads could not be broken out for several days, and the remarks of Mr. W. B. Markell, observer at Palmyra, vividly describe conditions that obtained over much of northeastern Missouri.

Nine stations, from Maryville and Bethany in the northwest and Lamonte and Marshall in the southwest plain to Steffenville and Palmyra in the northeast, reported falls of ten inches or more in the two-day fall. Koshkonong, in Oregon County, had 8.0 inches, but, in general, the snow melted almost as fast as it fell in southern sections.

The morning of the 5th was the coldest April morning of which there is any record. Twenty stations, mostly north of the Missouri River, reported readings of 10° or lower. Edgerton, Platte County, was the coldest point, with a minimum reading of 4° above zero. Over the State south of the Missouri River generally, temperatures ranged from 12 to 16° and only in the extreme southeast were readings above 20° reported.

April 16th—Severe thunderstorm at Kirksville and vicinity. Lightning killed one man and set several barns on fire. Kidder reported heavy hail from 6 p. m. to 6:30 p. m.; hailstones generally small and only minor damage resulted.

April 19th—A day of many local storms, some of which were severe. There was one local storm of the tornado type in Franklin and St. Charles counties. Severe hailstorms occurred in Montgomery, Lawrence, McDonald, Taney, Macon and Johnson counties. At Macon the noise of the ice bombardment caused the Circuit Court to suspend session. Greenhouses, roofs and windowpanes were damaged about $5,000. At Chilhowee, Johnson County, some stones were very large; in places hail lay 18 inches deep. Shingle and metal roofs were penetrated and everyone had windowpanes broken out. The damage is estimated at $8,000. At Anderson, McDonald County, was "the worst hail in years, breaking holes in roofs, smashing glass and damaging fruit trees." At Hollister, Taney County, "much damage to fruit."

A tornado-type storm swept an irregular path about 400 feet wide and about a mile long in the vicinity of Union, Franklin County, about 5:30 p. m. An old bridge across the Bourbeuse River, several barns, and small buildings were demolished. It developed to the southwest of the town and traveled northeast. About 7:30 p.m., the same storm, or perhaps another, appeared at St. Charles. As the storm crossed the Missouri River the surface of the water was seen to be raised about 30 feet where the funnel touched the water. It unroofed a large factory and broke down the water tank of the sprinkler system, causing serious flooding of three floors of the factory. Heavy planks in the yards of the car shops were tossed about like matches. Many buildings lost awnings or were damaged slightly. It was all over in four minutes. The property loss at Union is estimated at $7,000 to $10,000, and at St. Charles, $4,000 or $5,000.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIV. COLUMBIA, MO., MAY, 1920. No. 5.

GENERAL SUMMARY.

Excessive cloudiness and frequent showers were the marked features of May, 1920, in Missouri. The month as a whole was cool, but the temperature extremes were within the usual limits. It was the frequency of showers rather than excessive amounts that placed the month with the wet Mays. Continuous showery spells of from five to seven days were not infrequent, and as a rule there were not more than two to three days between showers; but in spite of the frequency the total monthly fall was less than normal over most of the State north of the Ozark Plateau.

The lack of sunshine was marked in all sections, and, in connection with many showers and cool weather, materially retarded normal farm work and crop development—so much so that plowing for and planting corn was just under way generally during the closing days of the month. Wheat and oats made fair progress, while pastures and meadows put on fine growth.

Thunderstorms were numerous and there were a few damaging hailstorms. For a more detailed report of storms see page 40.

TEMPERATURE.

The monthly mean for the State, as determined from the records of 65 stations, was 63.8°, or about 0.8° below the normal. The month was nearly 2° warmer than May, 1919, but more than 4° cooler than the same month in 1918. The northern half of the State was cooler than divisions south of the Missouri River, while the southeastern lowlands experienced about normal warmth. The warmest periods were from the 9th to 11th, 22d to 26th, and on the 31st. Maximum temperatures were 90° or higher at several stations on the 22d, 26th and 31st, 97° being the highest, at Caruthersville. The coolest period prevailed from the 13th to the 17th, but a minimum of 32° occurred at only two stations. There were no frosts.

PRECIPITATION.

The average precipitation for the State, 80 stations reporting, was 4.85 inches. The departure from the normal for 72 stations having 10 or more years' record was plus 0.04 inch, or practically normal. In the Ozark Plateau and southeastern lowlands the rainfall was 1.77 and 2.06 inches, respectively, greater than normal; and about 2.50 inches less than normal in the northwestern plateau, while the southwestern and northeastern plains received only slightly less than their normal amounts. The month was one of frequent but generally moderate showers, though rains occurred at many stations, particularly on the 12th-13th, and 16th-17th.

The greatest monthly amount, 10.15 inches, occurred at Farmington, though Lamar received nearly as much. The greatest amount that occurred in any 24 hours was 3.70 inches, at Lamar on the 19th-20th.

WIND.

The prevailing winds were from the northeast. The average wind movement was 6,818 miles, based upon the records of eight well located stations equipped with anemometers. The average hourly velocity was 9.2 miles, or about normal.

SUNSHINE AND CLOUDINESS.

The average number of clear days was 9, or about 5 less than normal. The average number of hours of sunshine was 231, or about 52 per cent of the possible, and about 11 per cent below normal. This May received about 4 per cent less sunshine than May, 1919, and 17 per cent less than the same month in 1918.

MISCELLANEOUS PHENOMENA.

Fogs, dense—1st and 20th.

Hail—3d, 4th, 12th and 20th. (See page 40.)

Halos, solar—6th, 9th, 14th, 23d, 30th and 31st. *Lunar*—29th and 31st.

Thunderstorms (general)—1st, 2d, 3d, 4th, 11th, 12th, 18th, 20th and 30th. More or less local on 5th, 6th, 19th, 21st, 22d, 23d, 27th, 29th and 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for May, 1920.

*Observations taken at 6.45 a.m. †Observations taken at 5.30 p.m. ** Included in next following measurement. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind.

DAMAGING STORMS.

The only damage resulted from local hail and windstorms.

2d.—Brunswick and vicinity sustained some damage to small fruits, gardens and small plants.

3d.—At 1 a.m., in Jackson County, south of Kansas City, a damaging hailstorm covered an area about a mile wide and 12 to 15 miles long. On the Sni-a-bar Road three sheep were killed by hailstones. Near that point stones were found measuring nine inches in circumference. Near Swope Park greenhouses were damaged about $5,000, by damage both to glass and flowers. Windowpanes, roofs and most crops suffered throughout the path of the storm. The total damage is estimated at $9,000.

4th.—Lebanon reported heavy hail that damaged small plants.

12th.—Two storms. Northern Phelps and Crawford counties, from Newburg to Cuba, there was an excessive rain, attended by heavy hail about 1 p.m. to 2 p.m. Most of the damage was due to the excessive rain washing the fields. The hail, though heavy, was of small sized hailstones generally, that caused no material damage.

Eastern Jasper and western Barry counties about 12.45 p.m. to 1.30 p.m. This is the most destructive storm ever known in this section. The path ranged from one to three miles wide and about 18 miles long. It was preceded by a strong squall wind that wrecked silos, unroofed barns and houses, blew down public service wires and poles, etc. The bombardment of hail that followed was terrific, so it is stated. Roofs were broken through, plastering knocked from the ceilings beneath and the homes deluged with water. Trees were stripped of small twigs and leaves and the bark bruised and peeled away. Cattle were cut by the hailstones until they bled; sheep, small pigs and chickens were killed. The larger hailstones were like eggs and larger and were numerous. After two days of bright sunshine hail drifts were two feet deep along the central portion of the path of the storm.

Damage occurred as far south as Purdy, Barry County. The loss to crops was the most serious damage. Much of the section visited is devoted to strawberries and this valuable crop will be almost a total loss. The large peony fields near Sarcoxie were ruined. Wheat fields were reduced to stubs, cornfields were ruined and must be replanted. The total loss is estimated at $500,000, though some place this value on the crop loss alone. Avilla, Megulin, Reeds, Larussell and Sarcoxie are the towns in the devastated area. The duration of the hail was 20 to 30 minutes.

29th.—A local excessive rain attended by hail occurred in Polk County about 2 p.m. Many oat fields were ruined and are being plowed and planted to corn. One report placed $3,000 damage valuation; others gave no estimate.

OBSERVERS' REMARKS—MAY.

Brunswick—Hail and heavy thunder on the 2d.

Fayette—The great amount of precipitation and unusual absence of sunshine have caused all crops to be backward.

Fulton—Very unusual amount of rainfall.

Gorin—Wet and cool first half of month, but warmer and more favorable the last half.

Macon—All farm work backward on account of unfavorable weather. On the 30th and 31st wonderful progress was made and corn planting going good.

St. Catherine—Corn looks good and is a good stand. The month has been generally good for farm work in this immediate vicinity, but too much rain three or four miles from here.

Warrenton—Earthquake shock felt on the first at 9.18 a.m. A cool, cloudy month until the last few days. Vegetation beginning to grow fast.

Farmington—Excessive rains have retarded farming very much, but such crops as have been planted, as corn, potatoes, gardens, etc., are doing well.

Gano—The month as a whole has been unfavorable for most farm work. Corn not near all planted; oats and meadows good; fruit promising good.

Houston—We have had lots of rain this month and it was fine on meadows and oats. Corn is growing good, but it is in need of more sunshine and work.

Lebanon—Heavy hail on the 4th, doing much damage to small plants.

Lockwood—A very wet May; all farm work delayed. Wheat, oats, pastures, meadows and gardens are good, but need sunshine and warmer weather.

Amoret—All crops look good; most of the corn has been planted. Wheat has made fine growth. Apples, cherries and peaches very light.

Appleton City—Too much rain and not enough sunshine for farm work. Pastures good; oats fine; wheat fair; corn slow on account of being too wet.

Warsaw—The first half of the month was too wet and cold for best results, causing loss by cut worms and decay of seed. The month closed ideal, with most crops looking fine. Some corn not planted yet.

Avalon—Rather cold and wet. Corn planting late; meadows and pastures doing well.

Grant City—Past month unfavorable for farm work, but most of the corn is planted. Wheat, rye, oats and alfalfa are looking well; pastures extra good. Some corn up and worked over.

Kidder—The month has been rather cool, with too much cloudy weather for crops of any kind to make much progress.

Liberty—On the 19th a strong wind did slight damage to small buildings and trees.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIV. COLUMBIA, MO., JUNE, 1920. No. 6.

GENERAL SUMMARY.

June, 1920, in Missouri, was characterized by moderate temperatures, average sunshine, rather drouthy conditions, and fresh breezes. From the physiological side it was a pleasant summer month. It also was favorable for nearly all out-door occupations, especially farm work.

Wheat harvest began about the 20th and worked gradually northward to the Missouri River by the last of the month, but only locally as wheat was backward this year. The prevailing dry weather favorably affected the crop, heads filling well with a plump heavy grain. Pastures, until the heavy rains of the last decade, deteriorated somewhat, but a fine hay crop was cut and stacked.

Corn planting had been greatly delayed in May, but June weather was favorable for this work. Farmers continued to plant corn up to and later than the 15th. At the close of the month the crop was small as a rule, but clean and growing well, with timely rains to help it along.

Thunderstorms were quite numerous, but they were mostly moderate. A few damaging storms occurred, however. For report on storms see page 48.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 64 stations reporting, was 72.7°, which approximates the normal for June. The weather was pleasant from the side of personal comfort, cool and warm periods of about equal length alternating. As a rule the first and third weeks were cool, and the second and last weeks were warm. The warmest days, when the maximum exceeded 95°, were the 13th, 14th, and 16th, and 27th, and 28th. The 100 degree value was reached at two stations along the southern border, on the 14th. The southern half of the State averaged about 1.5° cooler than the northern half.

PRECIPITATION.

The average precipitation for the State, 77 stations reporting, was 2.35 inches. The departure from the normal for 71 stations having 10 or more years' record was minus 2.16 inches. Precipitation was deficient in all sections, but good drouth breaking rains fell on the 21st-22d, and 29th-30th over all parts of the State, except a few eastern counties from about Warren and St. Charles south to Bollinger and Scott. During the first 20 days showers were of a light and local character, and the persistence of the drouth began to cause some apprehension. With such marked rainfall deficiency only cool weather prevented crop deterioration in most of the State.

WIND.

The prevailing winds were from the south. The average wind movement was 6,420 miles, 8.8 per hour, or about 9 per cent above normal. There were a few local wind storms.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the reports of 6 well selected stations having sunshine recorders, was 335, or about 75 per cent of the possible and about 5 per cent greater than normal.

MISCELLANEOUS PHENOMENA.

Hail— 2d, 7th, 8th, 16th, 21st, 22d, and 29th.

Halos, Solar— 1st, 3d, 7th, 8th, 9th, 19th, and 25th.

Lunar— 2d, 26th, and 29th.

Thunderstorms— 1st, 2d, 7th, 8th, 13th, 15th, 16th, 18th, 19th, 20th, 21st, 22d, 24th, and 29th.

ERRATA.

May, 1920: Kansas City, maximum temperature 23d should be 75°; and the monthly mean, 63.3°; the departure from normal, −1.2°. St. Catherine, highest temperature 83° on the 22d.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for June, 1920.

*Observations taken at 6.45 a.m. † Observations taken at 5.30 p.m. ** Included in next following measurement. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1918); but the Experiment Farm station has a freer exposure to sun and wind.

DAMAGING STORMS.

Damage during the month was local in several counties, due to rather severe thunderstorms, in two of which damage by hail also occurred.

On the afternoon of the 2d a barn west of New Madrid, a house or two in Marston, and numerous trees were blown down in a severe thundersquall that passed from north to south. On the morning of the 7th a large barn in Cameron was struck by lightning and burned, with an estimated loss of $3,000. On the morning of the 8th, a house near Bucklin was struck by lightning and damaged; the local telephone system of Bucklin was damaged considerably. Jackson County near Kansas City was visited by a thunderstorm and very heavy rain the same morning. Intense lightning together with the downpour of rain caused much damage to public utilities, truck and flower gardens were washed, and a balloon and hangar were blown down and destroyed. One man was killed, damage estimated $50,000.

Hollister, in Taney County reported a destructive wind and hail storm on the 16th, without indicating the extent of damage. Brunswick reported damage to trees, windows, and roofs on the same day.

On the 21st, wheat, oats, and fruit were damaged considerably in a wind and hail storm in southwestern Dent County. The damage is estimated at $25,000. Many other stations reported hail on this date but no other damage was indicated.

Only one station, Liberty, in Clay County, reported damage in the extensive thunderstorm area of the 29th. Thunderstorms and moderate to heavy rains were quite general throughout the State but no mention of wind damage is made, save a minor loss at Liberty.

OBSERVERS' REMARKS.

Brunswick — High wind on the 16th, damaging trees and roofs.

Kirksville — A fine growing month with no untoward weather occurrences.

Macon — Month very favorable to all crops and vegetation.

Palmyra — Extremely warm month. Wheat harvest commenced the 28th; yield about average; acreage about 65 per cent of the normal.

St. Catherine — June has been dry with an abundance of sunshine. Corn looks good and some has been "laid by". Meadows are good in the bottoms but rather light on the high land.

Bolivar — Month unusually dry and cool. The good rain of the 30th came in time to save corn from damage and to benefit pastures and young meadows.

Farmington — The drouth, coming so abruptly after the excessive rains of May, is being severely felt the last of the month. Early potatoes have been cut short and gardens are suffering, but wheat and oats were good and young corn is looking well. Fruit is of fair quality but the crop is light.

Gano — The weather has been very dry and everything is suffering.

Hollister — Destructive wind storm with hail on the 16th.

Houston — We have not had much rain this month but corn is clean and in good shape for growing if we can get rain. Wheat harvest is about over and early oats are harvested.

Lockwood — A very warm dry month, only one day with rain. Harvest is well advanced and corn looks good but the chinch bugs are bad and some damage has been done to crops.

Amoret — Corn all planted by the 12th, and growing fine. Commenced harvesting oats and wheat the 24th.

Appleton City — First part of the month was cool but as a whole it was favorable for general farm work. Wheat and oat harvest late on account of unfavorable spring. Less rain than in 1919.

Lamonte — Corn all clean and well cultivated. Wheat and oats being harvested since the 20th. Chinch bugs numerous and moving into cornfields in armies.

Warsaw — The entire month was dry but fine for farm work and wheat harvest which was completed. Glorious rain on the 29th-30th has relieved the drouth.

Avalon — Very dry from the first to the 29th. Splendid rain on the 29th came in the nick of time for the potato crop and meadows. Good harvest weather now.

Chillicothe — Corn looking fine; wheat and oats extra good and nearly all cut.

Grant City — Corn late but looks well and promises good crop; wheat fairly good; oats, alfalfa, meadows, and pastures extra good.

Kidder — The first ten days of the month were mostly cloudy with two heavy rains. High temperatures prevailed during the entire month.

Liberty — On the 29th there were a few light showers during the a. m. and in the evening a thunderstorm came from the southwest with some hail and strong wind.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIV. COLUMBIA, MO., JULY, 1920. No. 7.

GENERAL SUMMARY.

July, 1920, in Missouri, was relatively dry and cool, with nearly normal sunshine, and wind movement. From the side of personal comfort it was nearly an ideal summer month.

In most of the northwestern plateau and practically all of the southeastern lowlands showers were of sufficient frequency and adequate in amounts for nearly normal crop growth; but in the other three divisions the total rainfall fell somewhat short of the proper supply for best results.

Following a dry June the continued lack of moisture in July aggravated the drouth conditions to some extent, especially in parts of the southwestern plain thence northeast embracing the northern slope of the Ozarks and the lower section of the northeastern plain.

Late planting, and the prevailing moderate temperature condition gave considerable sustaining power to the corn crop, so that damage was not general at the close of the month. The most decided corn deterioration would be found in the counties of Warren, St. Charles, St. Louis, and Franklin; and probably, though of a somewhat less serious nature, from about Pike County southwest across Montgomery to about Miller, Maries, and Phelps. The weather was about ideal for harvesting, threshing, and other outdoor pursuits.

There were a few wind and hail storms, the damage being confined to small areas. For more detailed notes see page 56.

TEMPERATURE.

The monthly mean temperature for the State, 63 stations reporting, was 76.3°. The mean departure from the normal for 61 stations having 10 or more years' record was minus 0.9°. The month's warmth was quite uniformly distributed but the temperature deficiency was slightly more pronounced in the southwestern plain, and in the Ozark Plateau, than in the three other divisions. The weather alternated in short moderately warm and cool periods. There was very little excessive heat. The 23d was the warmest day, when day temperatures reached or exceeded the 100° value at about 44 stations; on the 9th, and 27th night temperatures ranged below 60° generally and below 50° at several stations.

PRECIPITATION.

The average precipitation for the State was 3.25 inches. The mean departure from the normal, for 71 stations having 10 or more years' record was minus 0.84 inch. The rainfall was below normal in all divisions but the deficiency was much less marked in the southwestern plateau, and in the southeastern lowlands. The precipitation was in the form of local showers, quite frequent, but as a rule light to moderate. The days of most widespread distribution were 2d, 5-6th, 13-14th, and 26th. There were some heavy local amounts. At Unionville, 3.80 inches fell within less than 24 consecutive hours on the 13th; and at Kansas City 3.84 inches fell within a 24-hour period ending on the 26th. The heaviest local monthly amounts were 7.22 inches at Unionville, 5.16 at Poplar Bluff, 5.87 at Koshkonong, 6.64 at Warsaw, and 9.78 inches at Kansas City.

WIND.

The prevailing winds were from the southwest. The average movement, based on the records of 8 stations equipped with anemometers was 5,267 miles, or about 7.1 miles per hour, which is about normal. Quite a high thunderstorm squall occurred at a few stations on the 1st, and there were some strong local winds on the 12th.

SUNSHINE AND CLOUDINESS.

There were 18 clear and 5 cloudy days. The average number of hours of sunshine was 345, or 76 per cent of the possible and about 5 per cent greater than normal; and about 11 per cent less than July, 1919.

MISCELLANEOUS PHENOMENA.

Hail. — 7th, 10th, 22d, and 24th.

Halos, solar. — 6th, 7th, 9th, 12th, 14th, 16th, 17th, 24th, 25th, 29th, and 31st. Lunar, 23d.

Thunderstorms. — General, 1st, 4th, 5th, 14th, 24th, and 31st. More or less local, 3d, 6th, 7th, 9th, 12th, 13th, 17th, 18th, 19th, 22d, 25th, 26th, and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1; of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily precipitation for July, 1920.

*Observations taken at 6.45 a.m. †Observations taken at 5.30 p.m. **Included in next following measurement. Both stations are located on the University grounds; one on the West Campus and the other about one mile southeast on the Experiment Farm. To prevent confusion of records the former will be known as "Columbia" and the latter as "University of Missouri." The equipment is the same in both cases (see Annual Summary, 1919); but the Experiment Farm station has a freer exposure to sun and wind.

DAMAGING STORMS.

July 1.— A thunder squall wind of 55 miles an hour at Kansas City broke the branches of many trees, which in frequent instances fell across public utility wires and cables causing considerable damage and inconvenience. At Warrensburg "the worst storm in years occurred from 7:30 p. m. to about 10 p.m." No damage reported.

July 6.— A thunder squall wind damaged large trees and several buildings at Brunswick.

July 7.— At 10:30 p. m. what may have been a small tornado caused damage estimated at $5,000 to $8,000 near Withers Mills, Marion County. The storm moved from northwest to southwest, in a path about one mile wide. Some trees on the south side of the path fell toward the southwest. Heavy hail fell over a small area with the wind storm.

July 10 and 24.— In Dent County there were damaging wind and hail storms, the one on the 10th being especially severe in the southwestern part of the county. Damage to crops was the most important item, though orchards and other trees, and sheds were damaged to quite an extent.

July 22.— A thunder squall and light hail caused minor damage in southwestern Cape Girardeau County.

OBSERVERS' REMARKS.

Brunswick.— Strong wind on the 6th, damaging large shade trees and buildings.

Gorin.— Cool month especially at night.

Macon.— Threshing going on at full swing. Corn needs rain although not suffering.

St Catherine.— Corn looks fine but is in need of a good rain. Hay was put up in fine shape.

Warrenton.— A dry hot month with a few light showers. The one of the 31st has done the most good but was too late to benefit some of the crops.

Jackson.— Severe thunderstorm with hail and electrical discharges on the 22d.

Farmington.— The most severe thunderstorm of the season occurred on the 24th. July was a fine summer month and made amends for June. The rains although moderate came in a good time and the heat was not excessive. Wheat and grass were good.

Gano.— There was a severe hail and rain storm in the south part of the country about the 10th, doing much damage. A wind storm on the 24th did much damage to orchards and out buildings.

Houston.— Everything is looking good since the rains of the 26th and 31st but the corn is cut a little short in this section. Gardens have suffered more than the corn. Pastures were getting short.

Lebanon.— Fine prospect for corn.

Lockwood.— Weather very favorable for threshing. Corn is needing rain and pastures are getting short. All farm work is up and plowing is well advanced for fall wheat. Rain needed badly.

Appleton City.— The month was favorable for farm work, but the last part was too dry for best results. Wheat crop good quality; oat crop fair. Corn is doing well but needs more rain. Pastures fair.

Warsaw.— The month has been ideal with no intense heat and plenty of moisture. Corn and pastures are fine. Threshing progressing and hay all in. Fall plowing begun.

Avalon.— This month has been very favorable for threshing and harvesting. Corn has done well but will need rain shortly. Pastures are getting short and dry.

Bethany.— One and twenty three hundredths inches of rain fell in fifteen minutes on the 18th with strong wind and lightning.

Edgerton.— Corn crop looking fine. Wheat very good; about 18 to 20 bushels to the acre. Fine weather for harvesting.

Grant City.— Wheat, oats, and hay all harvested with fair yields. Wheat testing 60 and above. Corn prospect good but needs rain.

Lexington.— Past month favorable in every respect.

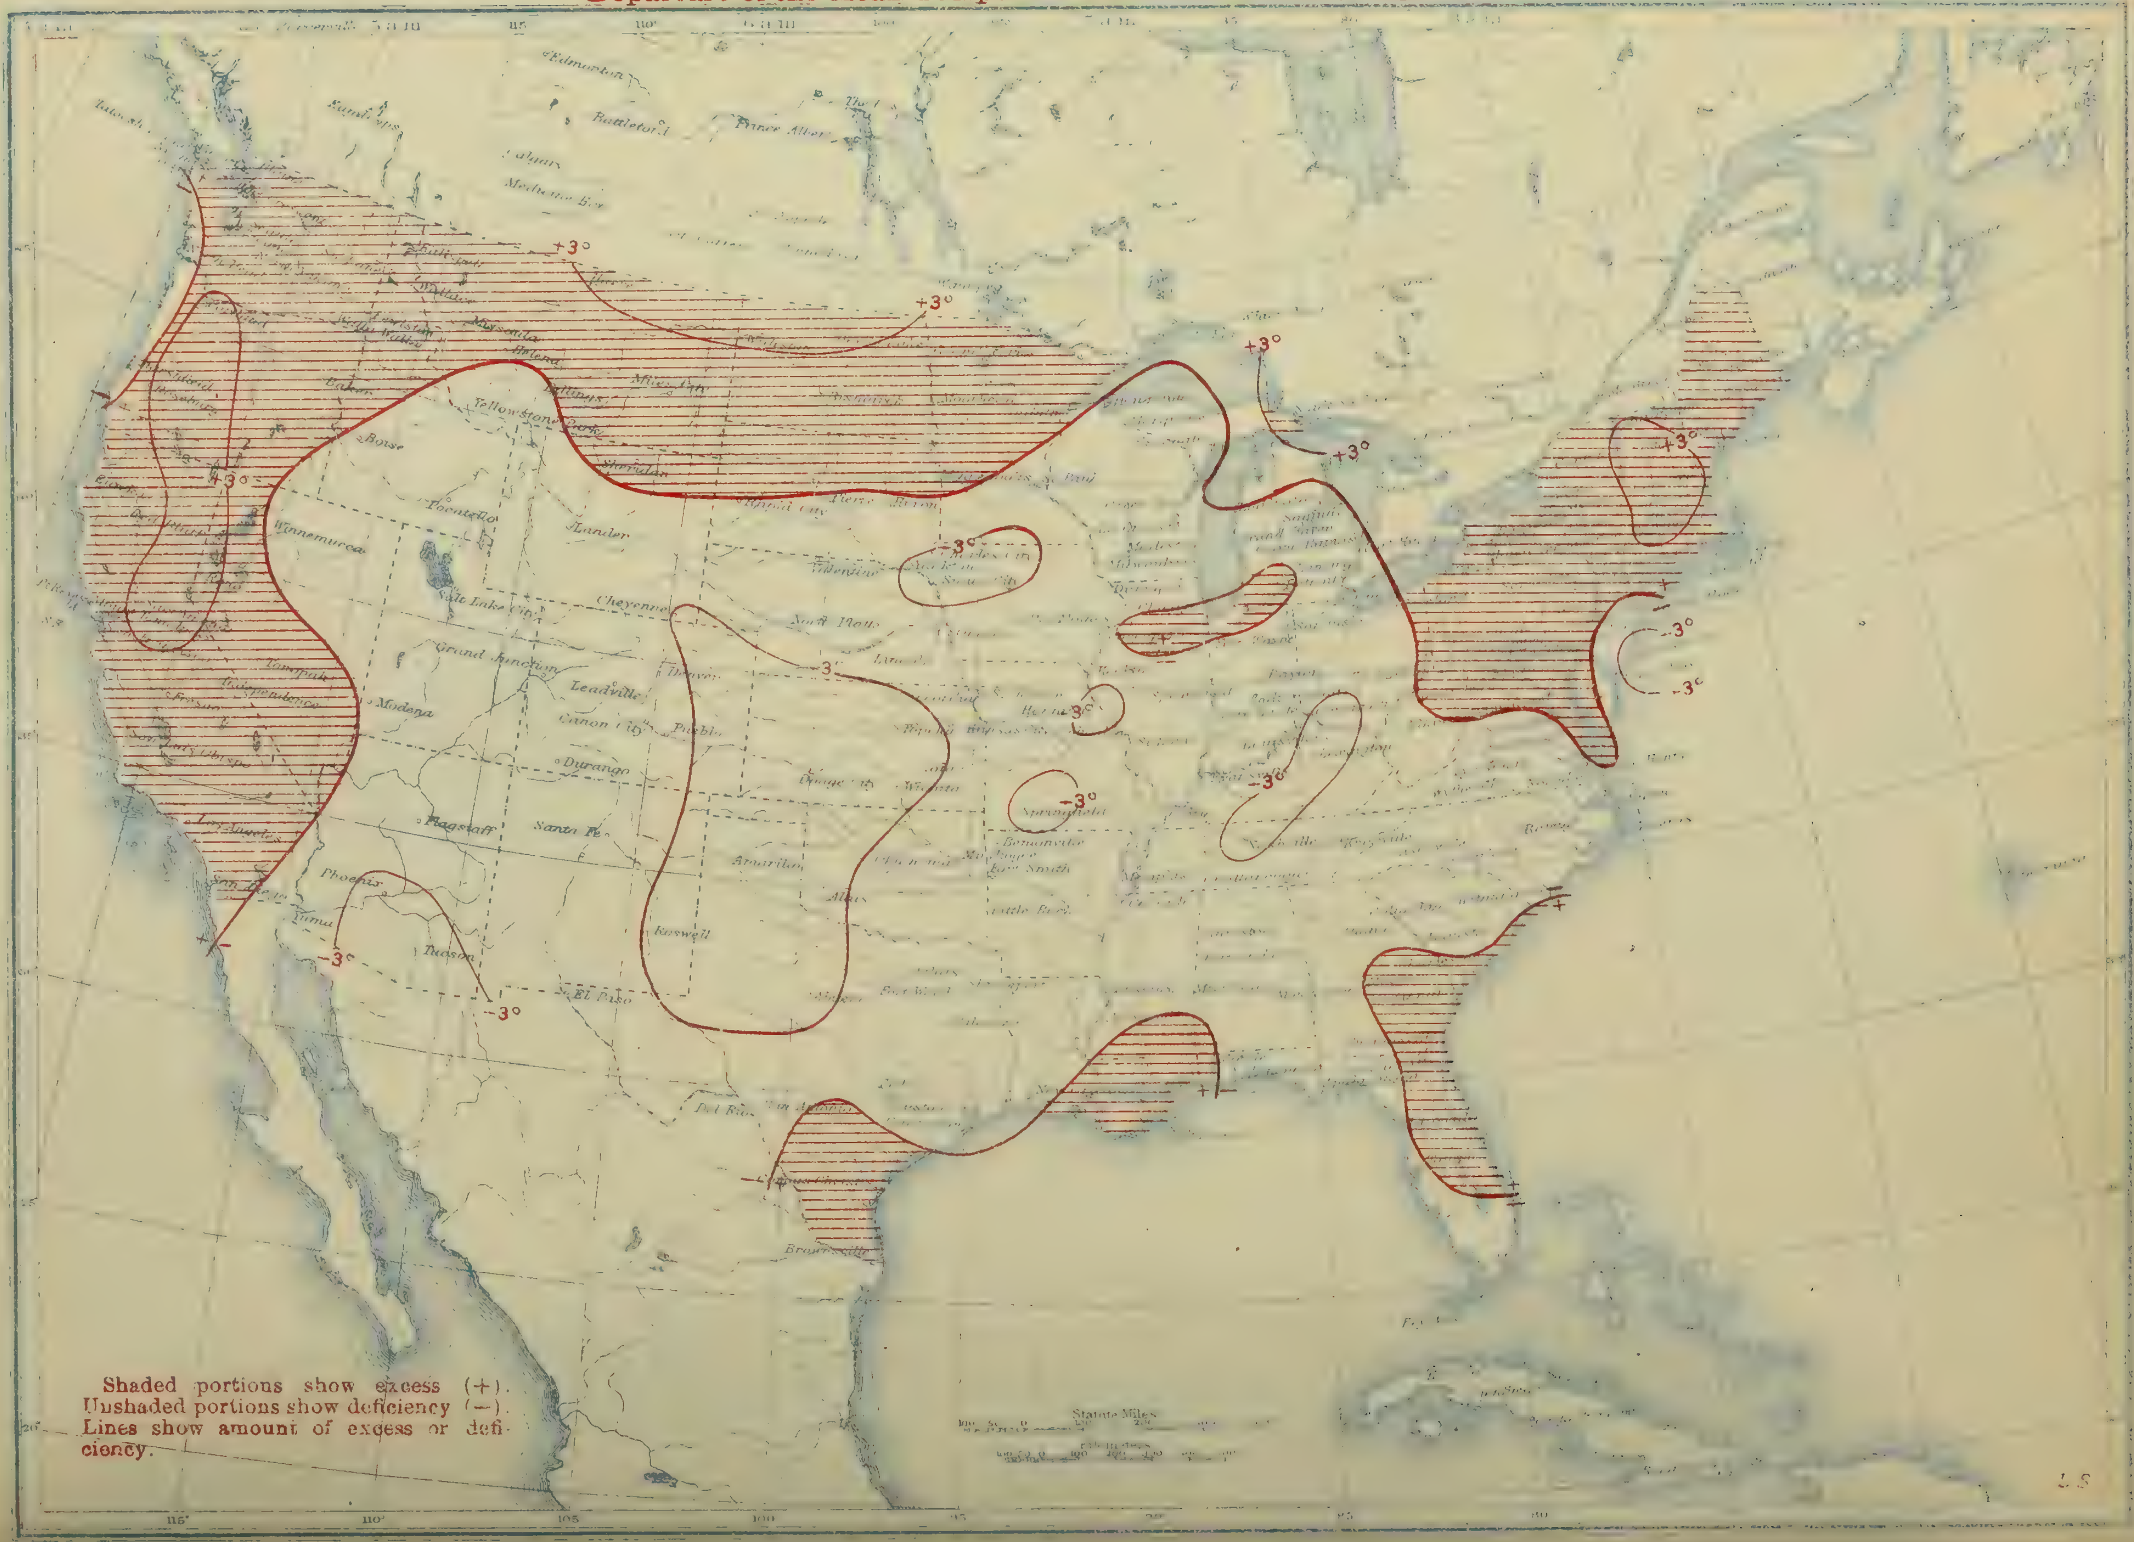
COLUMBIA, MO.
WEATHER BUREAU OFFICE
OCTOBER 19, 1920

Departure of the Mean Temperature from the Normal, August, 1920.



U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIV. Columbia, Mo., August, 1920. No. 8.

GENERAL SUMMARY.

The prevailing weather during August, 1920, in Missouri, was mostly cool, and cloudy, with some drouthy conditions during the first half and rather frepuent rains the latter half of the month. Altogether, it was a pleasant summer month.

As a rule, rains falling after the 10th of August, following drouth, are not of the highest value to corn; but as much corn was planted late because of the cool, wet spring, and early part of June, the rains of this August, falling as late as they did, were very helpful to corn, and of course to all vegetation not yet matured. At the close of the month corn was making satisfactory progress, and was in good condition, except in the east-central section where it had been damaged by drouth. Preparation for wheat sowing made good progress; and, as a rule, farm conditions generally were satisfactory.

Local wind and hail storms occurred in St. Louis County on the 7th; Saline on the 14th, and in Cass, and Bates counties on the 30th.

TEMPERATURE.

The monthly mean for the State, as determined from the records of 65 stations, was 73.1°, or 3.3° below normal. This is the third cool August of record, though about 3.3° warmer than the same month in 1915, the coolest in thirty years. All sections of the state were cooler than the normal, the largest deficiency, about 4°, occuring in the southwestern plain, and Ozark Plateau. Warm and cool periods alternated, the latter being somewhat longer as a rule, The warmest days covered the period from the 6th to the 10th, when maxima ranged well into the 90's, with the 100° value occuring at a few stations. The last ten days were the coolest of the month, the minimum temperatures ranging in the low 40's, but still several degrees above the low record of this month. The average number of days with maximum of 90° or higher was only five.

PRECIPITATION.

The average precipitation for the State, 77 stations reporting, was 4.78 inches. The departure from the normal for 71 stations having 10 or more years' record was plus 0.89 inch. This was the wettest August since 1915, all though the rainfall was slightly below normal in the northwestern plateau, and southeastern lowlands, and also in about 10 or 12 counties lying in the east-central section. There was a marked excess in the Ozark Plateau, and southwestern plain. Rather drouthy conditions prevailed during the first half of the month, though there were some heavy local showers; on and after the 19th showers were frequent, heavy, and quite general. The greatest local amount was 10.47 inches, at Osceola, and the least was 0.96 inch, at Maryville. The greatest amount in any 24 consecutive hours was 5.77 inches, at Seymour on the 20th.

WIND.

The prevailing winds were from the southeast. The average movement based upon records of eight well placed stations equipped with anemometers, was 4,792 miles, or 6.4 miles an hours, and about 6 per cent less than the average. There was some local wind damage, for which see special article.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of six stations equipped with sunshine recorders, was 288, or 68 per cent of the possible and about 4 per cent below normal.

MISCELLANEOUS PHENOMENA.

Fog, dense. — 10th, 13th, 14th, 21st, 24th, 26th, and 27th.

Hail. — 30th, and 31st.

Halos, solar. — 4th, 11th, 15th, 20th, 22d, 26th, 30th, and 31st. Lunar, 31st.

Thunderstorms. — General, 7th, 8th, 9th, 12th, 29th, 30th, and 31st. Local. — 6th, 10th, 11th, 13th, 14th, 15th, 21st, 25th, and 28th.

DAMAGING STORMS.

August 7. — A hail and wind storm caused some damage to shrubbery, gardens, and the telephone and electric light systems in the southern and southwestern parts of the City of St. Louis. A few trees were blown down.

August 14. — At 3 p.m. damaging hail fell over an area four miles long and three-fourths mile wide in the vicinity of Miami, Saline County. Corn was stripped of leaves, and it is estimated that 250 acres were damaged to the extent of 75 per cent of the yield.

August 30. — Severe hail and wind storms, accompanied by terrific thunder and lightning, crossed Bates and Cass counties in the afternoon. Southwest of Harrisonville corn was blown flat, a silo and windmill were wrecked, and a barn unroofed. Windows of a passing train were broken by hail. In Bates the damage was confined to crops.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield. Pacific. R. F. D. No. 1: of Dean. Anderson: of Gano. Salem. R. F. D. No. 5.

Daily precipitation for August, 1920.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIV. COLUMBIA, MO., SEPTEMBER, 1920. No. 9.

GENERAL SUMMARY.

September, 1920, in Missouri, was warm with about normal sunshine. There was ample moisture, except in a few counties in the east-central section. In the Southwest there was rather more precipitation than needed. Temperatures approximated the freezing value at some stations in the northern sections on the morning of the 30th, but there was no material injury to vegetation.

As a whole the month was favorable for crops and for farm work. At the close of the month the bulk of the corn crop was safely made; and preparation for wheat sowing was well advanced.

There were a few wind, and hail storms but the resulting damage was confined to small spots.

TEMPERATURE.

The monthly mean for the State, 62 stations reporting, was 70.0°. The departure from the normal for 60 stations having 10 or more years' record was plus 1.4°. Temperatures were above normal in all sections, but the warmth was less marked in the Ozark Plateau and in the northwestern section than in the other divisions. The first week was cool, then followed a long stretch of warm weather ending on the 28th. The last two days were the coolest of the month, temperatures approximating the freezing value occurred at a few stations on the morning of the 30th. There was very little damage. The warmest days were the 12th, 15th, 20th, and the 25th, when day temperatures ranged from near 90° to 100°.

PRECIPITATION.

The average precipitation for the State, 66 stations reporting, was 4.81 inches. The departure from the normal for 64 stations having 10 or more years' record was plus 0.92 inch. All of the State, except a relatively small area from Callaway to Pike, thence south to about St. Francois County, received more than the normal precipitation. The heaviest rains fell in the southwestern plain as a rule, though heavy local rains fell in the other divisions. Rains were frequent and general during the first 12 days, and again on the 22nd, 24th, and 27th. The greatest local monthly amount was 9.06 inches, at Clinton, while the least amount was 0.96 inch, at Farmington.

WIND.

The prevailing winds were from the south. The total number of miles, as determined from the records of 8 stations equipped with anemometers, was 5,875 miles, or an average hourly velocity of about 8.2 miles. This is about 5 per cent greater than normal. General brisk winds prevailed on the 10th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 regular stations with sunshine recorders reporting, was 259, or 70 per cent of the possible and about 5 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fog, dense. — 5th, 6th, 7th, 20th, 25th, 26th, and 27th.

Frost, light. — 30th.

Hail. — At St. Joseph on the 10th; and in the northeast part of the State on the 29th.

Halos, solar. — 1st, 2nd, 12th, 21st, and 27th. Lunar. — 21st, and 27th.

Thunderstorms. General on the 8th, 10th, 11th, 15th, and 26th. Local, 2nd, 4th, 5th, 7th, 12th, 13th, 14th, 23rd, 24th, and 27th.

DAMAGING STORMS.

8th. - St. Louis was visited during the late afternoon by heavy rainstorm attended by damaging winds. Nearly 3 inches of rain fell. Cellars were flooded in lower portions of the city. Considerable damage was sustained by public utilities; traffic was delayed by fallen poles. Many trees were blown down.

10th. - Central Shelby County reported excessive rainfall and damaging winds in the late afternoon. The town of Shelbyville was out of light and phone service and basements were flooded. Corn was blown flat; some windows were broken.

11th. - Excessive rainstorms frequently attended by hail were local over the northern portions of the State. In Harrison County about 4 p.m. the wind storm was 6 miles wide across the northern portion with damaging hail about 1 mile wide in the center of the strip. Near Eagleville, chickens were killed by the hailstones that were the size of walnuts. It is estimated that 1,000 window panes were broken. Barns were blown down, haystacks and timber were damaged, while a large acreage of mature corn was laid flat. The damage to crops is estimated at 25 per cent over the hail swept area, which comprises about 24 square miles.

Between 5 and 6 p.m. Linn County reported damaging winds and excessive rainfall; considerable corn was blown flat. About the same hour storm conditions prevailed again at Shelbyville, Shelby County, that had been flooded by a downpour the night before. There was a heavy fall of hail, and light and phone service was again interrupted. Water stood everywhere. The storm travelled northeast over Center and Clarence in Ralls County. At Center, the path was 200 yards wide. $500 damage to plate glass, several large cattle sheds, many small sheds and out-buildings, and shade and fruit trees were the chief items of property damage; much corn was blown down. At Clarence several large shade trees were uprooted, two of them falling on dwellings and causing several hundred dollars damage. There was terrific wind, heavy hail, and excessive rainfall for a period of ten minutes. Heavy damage occurred across the Mississippi River in the vicinity of Canton, Ills. Some corn was blown bown near Mexico, Audrian County, and a few large trees uprooted in a local high wind.

12th. - Minor hail damage at 3 p.m. in the vicinity of Doniphan, Ripley County.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Oakfield, Pacific, R. F. D. No. 1: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily precipitation for September, 1920.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIV. Columbia, Mo., October, 1920. No. 10.

GENERAL SUMMARY.

October, 1920, in Missouri, was exceptionally mild, being the warmest month of its name since 1900. The sunshine and the precipitation were about normal.

The most conspicuous feature was the long period of open, mild, even summer-like, weather, following the frost of the 1st, until about the 15th when a rainy period set in. With deeply tinted forests of many colors, and warm, sunshiny days and pleasant nights the first half of the month was an almost continuous period of "beautiful weather", the term fittingly applied by the general public.

There was quite a heavy frost on the morning of the 1st, but the resulting damage was very slight; and while the latter half of the month was rather wet, it was mild, and the growing season did not fully close until the 29th, the date of the first general freeze.

Taken altogether it was a month highly suitable for out-door life, and farm pursuits; and, bearing in mind the high cost of all the necessities of life, the prolonged mild weather and vegetable growing season possessed great economic value to the people of this State.

At the close of the month practically all of the winter wheat crop had been sown, and much was up to good stands, the color and general condition being excellent. Only a small percentage of the late planted corn was damaged by the frost of the 1st. Pastures continued in excellent condition generally.

TEMPERATURE.

The monthly mean for the State, 63 stations reporting, was 61.3°. The departure from the normal for 60 stations having 10 or more years' record was plus 4.3°, and the greatest excess for this month since 1900. The temperature excess was quite evenly distributed, the Ozark Plateau being a little less warm than the other divisions. From about the 8th to the 25th, inclusive, temperatures were almost constantly above normal.

The coldest days were the 1st, 28th, and 29th, and these were the only days with freezing temperature. There was quite a heavy frost on the morning of the 1st, but the growing season continued until the 29th, when the first general freeze occurred. The highest temperature was 93°, on the 23rd at Caruthersville, and the lowest was 18°, at Bethany, and Edgerton, on the 29th.

PRECIPITATION.

The average precipitation for the State, 79 stations reporting, was 2.89 inches. The departure from the normal for 70 stations having 10 or more years' record was plus 0.25 inch. The precipitation was fairly well distributed, the southern half of the State receiving slightly more than the northern half. There was very little precipitation during the first 10 days, but it was rather frequent from about the 15th to the 27th, inclusive. The heaviest local monthly amount was 6.09 inches, at Neosho, and the least, 0.90 inch, fell at Downing. The greatest amount in any 24 hours was 2.45 inches, at Caruthersville on the 26th.

WIND.

The prevailing winds were from the south. The average monthly wind movement, 8 stations equipped with anemometers reporting, was 6,749 miles, or an hourly velocity of about 9.1 miles. This is about 6 per cent above normal for October. There were no damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 well-placed stations, was 229. This is 68 per cent of the possible, or about 2 per cent above normal; and about 22 per cent more than was experienced in October, 1919.

MISCELLANEOUS PHENOMENA.

Earthquake. — Slight tremors at 8.15 a.m., and again at 1.50 p.m. on the 3rd.

Fogs, dense. — 4th, 7th, 9th, 25th, and 29th.

Frosts, heavy. — On the 1st. Killing, at a few stations on the 1st, and general on the 29th.

Hail. — None reported.

Halos, solar. — 2nd, 10th, 12th, 13th, 15th, 16th, 22nd, 23rd, 24th, 30th, and 31st. Lunar. — 16th, 21st, 22nd, 24th, 30th, and 31st.

Thunder was heard on the 11th, 14th, 15th, 18th, 22nd, and 26th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing: for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for Ootcber, 1920.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIV. Columbia, Mo., November, 1920. No. 11.

GENERAL SUMMARY.

November, 1920, in Missouri, was somewhat colder and drier than usual, but the percentage of sunshine and the movement of winds were nearly normal.

Except for the quite severe cold period, from about the 10th to the 17th, inclusive, during which there were several typical winter days, the month was generally favorable for outdoor pursuits. The highways were in good condition most of the time, and automobile travel was heavy.

Wheat made fair growth, and the condition was good generally, save a few fly infested spots in some of the early sown. Corn husking and cribbing made about the average progress. Pastures continued to furnish good grazing, and live stock enter winter in fine condition.

TEMPERATURE.

The monthly mean for the State, 67 stations reporting, was 40.9°. The departure from the normal for 64 stations having 10 or more years' record was minus 3.5°, and the largest deficiency since 1911. Mild and cold periods of from three to seven days followed each other quite regularly, the longest period, from the 10th to the 17th, inclusive, being quite typical winter. On the 13th, the coldest day, 35 stations reported readings of from 6° to 10° above zero. Monthly means varied from 35.2° at Maryville to 48.6° at Caruthersville. The average number of days with minimum 32 was 17. There were no zero temperatures.

PRECIPITATION.

The average precipitation, as shown by the records of 85 stations, was 1.21 inches. The departure from the normal for 79 stations having 10 or more years' record was minus 1.09 inches. Precipitation was below normal, except in the northwestern plateau; and the deficiency was quite marked in all other divisions. Precipitation was general on the 1st, from the 7th to the 9th, and the last two days; occasional and light from the 10th to the 28th. Appreciable snow fell on the 15th at nine stations, the heaviest fall being 1.0 inch, at Unionville.

WIND.

The prevailing winds were from the northwest. The average monthly movement, 8 stations equipped with anemometers reporting, was 6,830 miles, or an average hourly velocity of 9.5 miles. This is about the usual for this month. Brisk winds occurred on the 1st, and 20th, but no damage was reported.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well selected regular stations equipped with sunshine recorders reporting, was 139, or about 47 per cent of the possible, and about 10 per cent less than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense. — 7th, 8th, and 28th.

Halos, solar. — 5th, 6th, 7th, 11th, 17th, 19th, and 28th. Lunar. — 3rd, 19th, 25th, and 27th.

Sleet. — St. Louis on the 26th; Springfield, 15th, and at Kansas City on the 21st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record. but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing: for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for November, 1920.

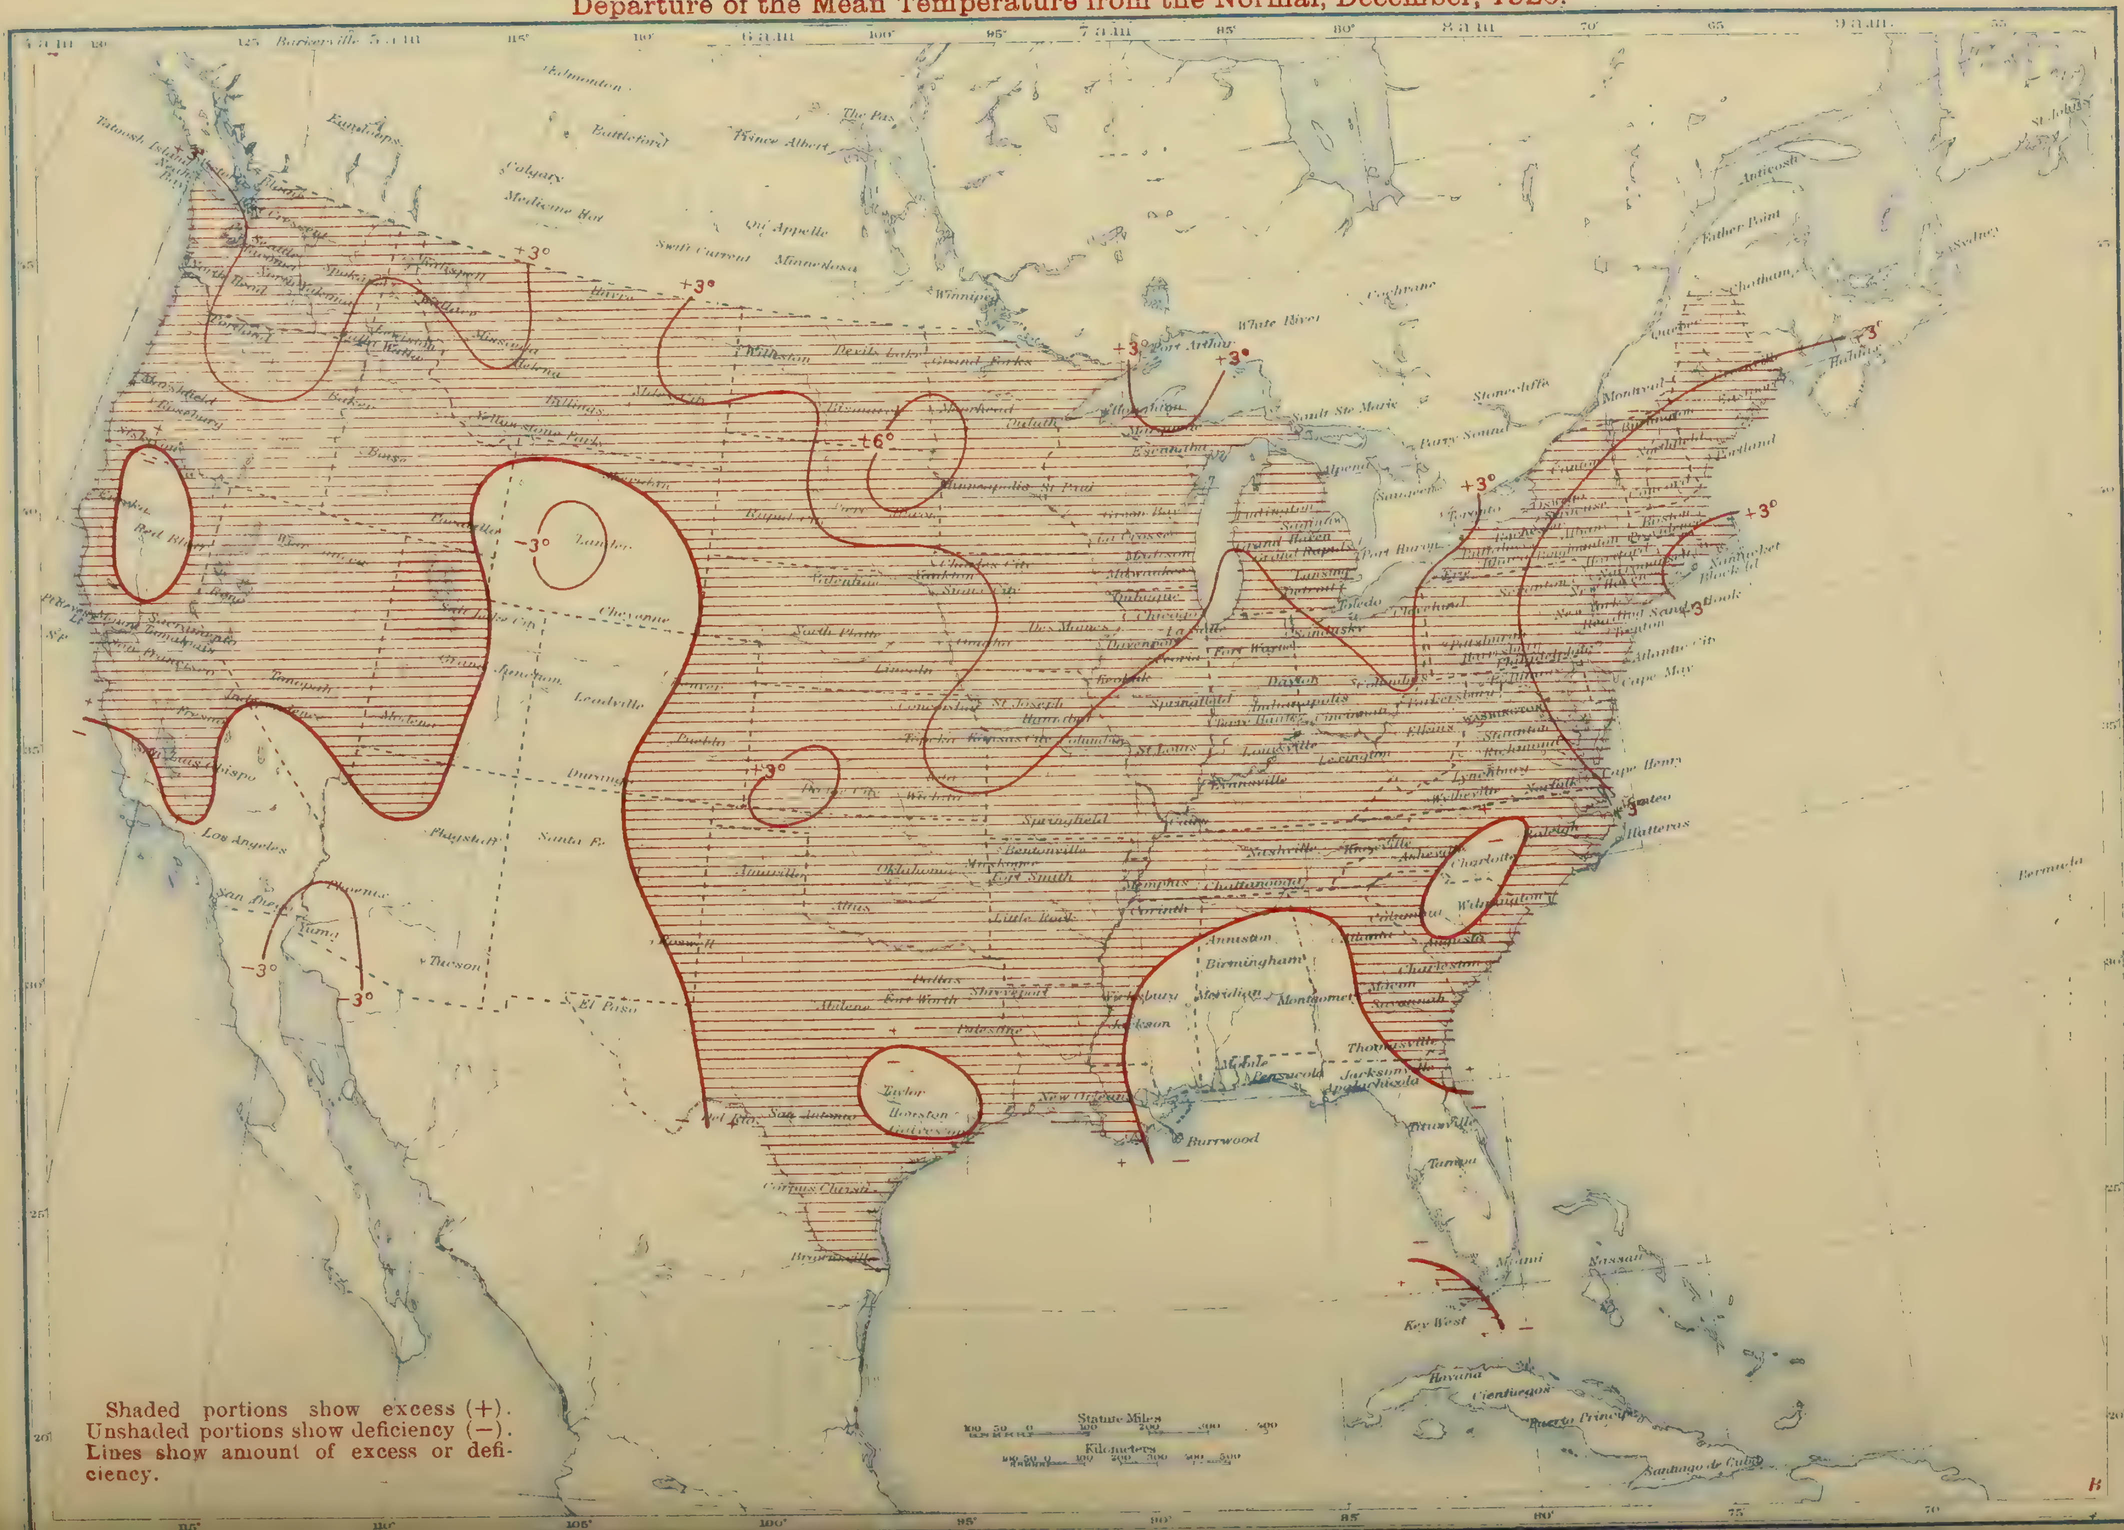
Departure of the Mean Temperature from the Normal, December, 1920.



Shaded portions show excess (+). Unshaded portions show deficiency (−). Lines show amount of excess or deficiency.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXIV. Columbia, Mo., December, 1920 No. 12.

GENERAL SUMMARY.

December, 1920, in Missouri, was mostly bright and pleasant. There was no snow and not much cold weather until the last week. There was more wind than usual, but on most of the blustry days the wind came from southerly points.

Precipitation differed but little from the normal, and fell at regular intervals. The first half of the last decade was the most disagreeable, being rather cloudy, foggy, and wet.

The usual farm work was carried on without much interference. Live stock was on pasture most of the time and fared well. The wheat crop had a good color and was in satisfactory condition generally.

TEMPERATURE.

The monthly mean for the State, as shown by the records of 68 stations, was 35.6°. The departure from the normal for 65 stations having 10 or more years' record was plus 2.6°. The present month was about 7° warmer than last December, and about 4° colder than December, 1918.

Eighteen days were warmer than normal, the first two weeks being unusually mild and pleasant. There were about six typical winter days, days on which the maximum did not rise above 32°; the minimum temperatures were 32° or lower on 21 days, but zero occurred only on one day, the 28th.

PRECIPITATION.

The average precipitation for the State, as determined from the records of 85 stations, was 1.93 inches. The departure from the normal for 75 stations having 10 or more years' record was minus 0.22 inch. All sections, except the southeast, experienced a small deficiency in precipitation. In the southeastern lowlands the month was wetter than normal, the moisture being somewhat more than needs required. Precipitation was general on the 4th, 13th, and 14th, and the period from about the 21st to the 26th was rather cloudy and wet.

The first snow of importance began during the afternoon of the 25th and continued over the 26th; the average depth, for the State as a whole, being 2.3 inches. Nearly all of it had evaporated or melted by the 29th. The normal snowfall for December is about 3.5 inches.

WIND.

The prevailing winds were from the northwest, but, as the mild conditions indicate, it blew from southern points on many days. The average monthly movement was 8,840 miles, or an average hourly velocity of 11.9 miles. It is the windiest December of record, though strong winds occurred on but two days, the 13th, and 15th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, for the State as a whole, was 145. This is about 50 per cent of the possible, and practically normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense. — 1st, 4th, 5th, 6th, 13th, 21st, 22nd, 26th, and 31st.

Hail. — 4th, and 14th.

Halos, solar. — 2nd, 8th, 11th, 16th, 17th, 18th, 20th, 23rd, 28th, and 29th. Lunar. — 16th, 17th, 18th, 19th, 23rd, 24th, 29th, and 30th.

Sleet. — 7th, 20th, 21st, 22nd, 25th, and 26th.

Thunder was heard on the 4th, 13th, and 21st.

OBSERVERS' REMARKS.

St. Catharine. — This has been a fine month for live stock, and there has been enough grass to keep them.

Warrenton. — Fine autumn weather has prevailed much of the time.

Bolivar. — The month has been pleasant, and favorable for outdoor occupations.

Hollister. — Quite severe hailstorm on the 13th. Stones about as large as hen eggs.

Lockwood. — A fine winter month. Wheat is in good condition; and there is ample moisture. All work well advanced.

Appleton City. — December was rather dry but fine for outdoor work. Wheat is doing well.

La Monte. — Most of the corn has been shucked and cribbed.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing: for example, b represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for December, 1920.

VOL. XXV. COLUMBIA, MO., JANUARY, 1921. No. 1.

GENERAL SUMMARY.

January, 1921, in Missouri, was one of the most pleasant months of the name, particularly as to the prevailing temperatures, that has occurred in about thirty years. The last ten days of the month, however, were somewhat too cloudy and wet for outdoor occupations.

So continuously mild was the weather that remarks to the effect that "our climate has changed" and "never before has a winter been so mild in Missouri" were quite common. To trust to memory alone is not a safe plan. It is a climatological fact, that after one has lived about thirty years in the same place or latitude, the succeeding years of life in the same place can scarcely bring to one any weather markedly different from conditions experienced at some time during the first thirty years. But one must have carefully recorded climatic data with which to check one's memory.

Our records show that the weather of this January had its duplicate in that of January, 1914. In fact, January, 1914, was a little milder, and had less cloudiness and precipitation (including snow), consequently had more sunshine, and, from the side of personal comfort, was even a more pleasant winter than January, 1921. Several Januarys have been nearly as mild.

The winter wheat crop was in good condition. In southern sections fruit buds had begun to swell, causing some uneasiness for fear of premature blooming with possible subsequent frost damage.

TEMPERATURE.

The monthly mean temperature for the State, 66 stations reporting was 37.1°. The mean departure from the normal for 64 stations having 10 or more years' record was plus 7.2°. Only once before (1914) has such unusual and continuous mild weather prevailed in January as during the present month. Except five or six days during the middle of the month temperatures were almost continuously above the normal in all sections, the average daily excess ranging from about 6° in the Southeast Lowlands and Ozark Plateau to nearly 8° in the Northwest section of the State. Zero occurred on one day, the 17th, at three stations; and minimum temperatures reached 32° or lower on only 21 days.

PRECIPITATION.

The average for the State, 84 stations reporting, was 1.88 inches. The departure from the normal for 73 stations having 10 or more years' record was minus 0.38 inch. There was not much precipitation during the first ten days; general precipitation occurred on 12th, and the last eight days were, as a rule, cloudy and wet. The total fall for the month was sufficient for needs and well distributed geographically. The largest local amount was 4.06 inches, at Birchtree, and the least was 0.51 inch, at Kidder.

There was one snow, general over the State, on the 13th. Over the central and western parts of the State it was quite a deep snow, the amounts ranging from 6 to 8 inches, and even to 9, 10, and 11 inches in a few localities. It melted rapidly and practically was gone by the night of the 15th.

WIND.

The prevailing winds were from the south. The total number of miles, 8 stations equipped with anemometers reporting, was 7,668, or an average hourly velocity 10.3 miles. There were no strong winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations with sunshine recorders reporting, was 141, or 46 per cent of the possible, and about 5 per cent below normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—8th, 22nd, and 29th.

Halos, solar.—4th, 10th, 11th, 12th, 20th, 23rd, and 27th. Lunar.—15th, 16th, 17th, 19th, 20th, 23rd, 27th, and 28th.

Sleet.—13th and 24th.

Thunder was heard locally on the 1st and 29th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record. but all complete reports are used in determining section or division means.

Reference letters, ª, ᵇ, ᶜ, appearing in the table indicate number of days missing: for example, ᵇ represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for January, 1921.

VOL. XXV. COLUMBIA, MO., FEBRUARY, 1921. No. 2.

GENERAL SUMMARY.

Considering the weather elements together (temperature, wind, humidity, sunshine, and precipitation), February, 1921, in Missouri, was, perhaps, the most pleasant winter month that has occurred in about thirty years. The entire winter has been exceptionally mild. And in this respect it has its close counterpart in the winter of 1889-90.

The mean monthly temperature for the State as a whole, 40.1°, has never been equaled, although it has had some close competitors, namely, in 1909, 1911, and 1915. The prevailing dry atmosphere and absence of high winds made the weather particularly pleasant from the physiological side. The human body is very sensitive to damp, windy weather.

While there was a marked deficiency in precipitation over the greater part of the State, the moisture that was received was sufficient for present needs. February in other years since 1867, as compared with the present, has been drier seven times, namely, 1868, 1870, 1895, 1904, 1917, and 1920. There are exceptions to all general rules, but as a general thing a relatively dry winter month is a cold winter month and, a mild winter month is a wet one.

The soil was in good condition, and much plowing was done; at the close of the month probably a third of the oat crop had been sown. Winter wheat was in fine condition.

Because of the unseasonably mild weather fruit buds had been forced out about a month ahead of the seasonal stage. This constitutes a precarious condition for these crops.

TEMPERATURE.

The monthly mean temperature, 65 stations reporting, was 40.1°. This is about 9.1° above the normal and the greatest plus departure since the beginning of records in 1888. The previous mildest February was 1915, with a mean temperature of 39.4°. The distribution of warmth during the present month was like that of 1915, that is, the northern half of the State was milder than the southern half. Both of these Februarys were only 3° or 4° colder than the normal condition of March.

No zero temperatures occurred; and only four stations reported readings lower than 10°, namely, Neosho, Dean, Unionville, and Edgerton, quite widely separated places. Seven stations reported day temperatures of 80° or higher, the maximum being 86°, at Bolivar on the 16th. The average number of days with minimum of 32° or lower, was 19.

PRECIPITATION.

The average precipitation, 83 stations reporting, was 0.94 inches. The departure from the normal for 68 stations having 10 or more years' record was minus 1.33 inches. Except along the immediate southern border, where there was a slight excess, the deficiency was quite marked and uniformly distributed, the total monthly fall being less than one inch. Nearly all precipitation fell during two relatively short periods, embraced in the first and third decades.

A heavy snow fell over southern sections on the 19th, and 20th, the deepest, between 9 and 15 inches, occurring in the southeastern lowlands; it soon melted and much melted as it fell. Over the remainder of the State, particularly north of the Ozarks, there practically was no snow cover.

WIND.

The prevailing winds were from the southwest. The average wind movement, based upon 8 stations equipped with anemometers, was 6,979, miles, 10.4 miles an hour, or about normal. There were no damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the records of 6 well distributed stations equipped with sunshine recorders, was 182. This is about 60 per cent of the possible and about 6 per cent more than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—4th, 5th, 7th, and 8th.

Hail.—At Springfield, on the 7th.

Halos, solar.—3rd, 4th, 6th, 12th, 17th, 18th, 20th, 21st, 24th, and 25th. Lunar.—17th, 18th, 19th, 20th, 21st, and 22nd.

Thunderstorms, local.—4th, 5th, 7th, and 26th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record. but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for February, 1921.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXV. COLUMBIA, MO., MARCH, 1921. No. 3.

GENERAL SUMMARY.

March, 1921, in Missouri, like the preceding winter months, was characterized by a remarkable and persistent mildness up to the last three or four days.

The unusual and prolonged spell of mild weather will further be impressed upon our memories by placing in review here the marked positive temperature departures of the past four months.

The average departure from normal temperatures during December, January, February, and March, was plus 6.4°. January, February, and March, plus 8.1°. February and March, plus 8.8°. From these data we may conclude that the prevailing warmth of the season just closed approximated the mildness of winters normal to latitudes of from 100 to 170 miles farther south. This is equivalent to a geographic displacement. Missourians, then, climatically, spent the four most unpleasant months in Arkansas.

The cold wave that overspread the State on the 28-29th was a sudden and severe change. From the side of personal comfort it was decidedly unpleasant. Vegetation, which was a month ahead or earlier than its usual March state, was severely damaged. To fruits the freeze was well-nigh disastrous. Oats, alfalfa, and clover were considerably damaged; but winter wheat was not seriously affected. Spring plowing and farm work in general were well ahead of the average.

TEMPERATURE.

The monthly mean temperature, based upon the records of 65 stations, was 51.9°. The mean departure from the normal for 62 stations having 10 or more years' record was plus 8.5°. This March was the third warmest of the name in thirty years. Also it was the fourth consecutive month of above normal temperature values, and the third consecutive month of marked positive departures. The general persistence of warmth was the unusual feature. The first real cold snap did not occur until the 28th, and the 29th; and the drop was from almost summer warmth to that of winter. The warmest days perhaps embraced the period from the 15th to the 18th, inclusive, when the day temperatures ranged in the high 80's generally. During the only cold spell — the last four days — minimum temperatures ranged from 11° above zero at Maryville, to 29° at Caruthersville Fifty stations reported temperatures of 20° or lower. The sudden change from pleasant warmth to winter cold was not only decidedly unpleasant from the side of personal comfort, but it was well-nigh disastrous to most vegetation.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, was 4.69 inches. The departure from the normal for 73 stations having 10 or more years' record was plus 1.68 inches. The precipitation was copious in all sections, and in all but the northwestern plateau, was markedly excessive. The soil, however, being relatively dry, took up the excessive moisture quite readily. The more or less heavy and general rains fell from the 6th to the 8th, and from the 21st to the 28th. During the second decade precipitation was frequent but in the form of local showers. The greatest monthly fall was 11.23 inches, at Dean. The greatest amount in any 24 consecutive hours was 2.88 inches, at Dean on the 27th.

A quite general but moderate snowstorm occurred on the 27th.

WIND.

The prevailing winds were from the south. The average wind movement, 8 stations equipped with anemometers reporting, was 9,190 miles, or about 16 per cent above normal. Winds of 35 miles an hour prevailed on the 5th and 26th. No damage was reported.

SUNSHINE AND CLOUDINESS.

There were 13 clear days, 9 partly cloudy, and 9 cloudy days. The average number of hours of sunshine, 6 well selected stations reporting, was 218. This is about 59 per cent of the possible, and about 4 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—6th, 7th, 12th, 13th, 14th, and 17th.

Frosts, killing.—28th, 29th, 31st.

Hail.—7th, 8th, 16th, 25th, 26th, and 27th.

Halos, solar.—1st, 2d, 18th, 21st, 25th, and 26th. Halos, lunar.—8th, 16th, 17th, and 21st.

Sleet.—27th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for March, 1921.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXV. COLUMBIA, MO., APRIL, 1921. No. 4.

GENERAL SUMMARY.

April, 1921, in Missouri, was wetter than usual, but moderate temperatures prevailed, as a rule. One cold spell occurred, and killed most of the fruit remaining after the March freeze.

There were a few local hail storms, and windstorms. Except the Black River, in the southeastern part of the State, which went out of banks on or about the 25th, there was no special flood damage.

Farm work, particularly preparing fields for corn planting, was delayed by wet soil. On the other hand the weather was generally favorable for winter wheat, meadows, and pastures.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 66 stations reporting, was 56.0°. The departure from the normal for 64 stations having 10 or more years' record was plus 0.9°. The month was cooler than normal in the Ozark Plateau, about normal in the southwestern plain, and about 1.5° warmer than usual in the other three divisions. The first 10 days were continuously warm but after that cool and warm spells of from 2 to 5 days duration followed each other quite regularly. The highest day temperatures, ranging between 85° to 91°, occurred on the 23d, 24th, and 25th. The coldest spell covered the 16th, 17th, and 18th, when, especially on the last two dates, a general freeze obtained.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, was 5.37 inches. The departure from the normal for 74 stations having 10 or more years' record was plus 1.52 inches. There was an excess of moisture in all sections. There were four distinct rain periods, 5th to 9th, 13th to 17th, 20th to 23d, and 25th to 30th. The greatest monthly fall was 8.42 inches, at Arcadia, and the least was 1.86 inches, at Conception. The greatest fall in any 24 consecutive hours was 4.20 inches, at Birchtree.

From about the 26th to the 28th the Black River, in the southeast, went out of banks, flooding the lowlands. About 100 families were forced from homes, and other damage was done, but no lives were lost.

There was a general snow on the 15-16th. Over the northwestern sections the ground was covered to depths of from 2 to 6 inches; in Buchanan, Holt, and Atchison counties it was from 7 to 12 inches deep.

WIND.

The prevailing winds were from the south. The total number of miles, 8 stations equipped with anemometers reporting, was 8,568 miles, or an average hourly movement of 12.0 miles. Quite high winds prevailed on the 16th, and 25th. During the afternoon of the 26th, a small tornado crossed a small section in the northern part of Macon county; several barns and other outhouses were blown down.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well-placed stations with sunshine recorders reporting, was 248, or 63 per cent of the possible and about 2 per cent above the normal.

MISCELLANEOUS PHENOMENA.

Frost, light—11th, 19th, and 29th. Heavy—1st, 10th, 11th, and 18th. Killing—1st, 10th, 11th, and 18th.

Hail—6th, 25th, and 28th.

Halos, solar—2d, 3d, 4th, 5th, 7th, 11th, 12th, 15th, 22d, 24th, 29th, and 30th. Lunar—14th, 19th, 20th, 21st, 24th.

Thunderstorms—6th, 7th, 8th, 15th, 16th, 25th, 26th, 27th, and 29th.

STORM DAMAGE.

St. Louis: A thunderstorm prevailed from about 6:40 p. m. to after 7 p. m., April 25th. The highest velocity for five minutes was 33 miles, from the north. Lightning was severe; and 1.07 inches of rain fell within 34 minutes. Three homes were struck by lightning, according to the city newspapers; the total damage was about $400. Slight damage was done to the wire systems of the telephone companies, and Union Electric Company. The hailstones were small and melted immediately after falling.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for April, 1921.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXV. COLUMBIA, MO., MAY, 1921. No. 5.

GENERAL SUMMARY.

The sudden change from cool and showery weather to dry and hot along about the middle of the month was the outstanding feature of May, 1921. The entire year 1921, up to May 31st, has furnished more heat than any other similar five months of any year in the climatological history of the State. At Columbia, the section center, which is situated near the center of the State, the accumulated excess in temperature from January 1st to May 31st amounted to 1005°. This borders on the phenomenal.

The first part of the month was rather too wet for much field work, but by the close of the month the corn crop was in, and grain germinated well. Wheat improved after the dry weather set in, but the unusually high temperatures forced the head-making too much. Oats were rather poor, never having fully recovered from the late spring freezes. Grasses did well.

There was some local damage by excessive rains, hail, and wind.

TEMPERATURE.

The monthly mean for the State, as determined from the records of 68 stations was 66.4°. The departure from the normal for 65 stations having 10 or more years' record was plus 2.0°. The month was nearly 3° warmer than May, 1920, and about 5° warmer than the same month in 1919. The first part of the month was cooler than normal, with some quite cold nights during the first week; but along about the 17th there was a sudden change to summer weather, and from that date to the close of the month high temperatures obtained. The warmth of this period rather more than equaled the normal warmth for the same time in June. The highest temperature, 102°, on the 23rd, has been equaled or exceeded but once in the past 30 years, and that was in 1895. An injurious frost occurred on the morning of the 3rd. Temperatures of 32° or lower occurred at 15 stations on 2nd or 3rd.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, was 3.69 inches. The departure from normal for 77 stations having 10 or more years' record was minus 1.20 inches. The deficiency was somewhat more marked over the eastern half of the State than over the western half. Rain was general and copious on the 1st, 2nd, and from about the 7th to the 11th; following the 12th and up to about the 24th, there was scarcely any rain at all; during the last week local showers fell on several days.

The greatest monthly amount was 7.54 inches, at Kansas City, but from 5 to over 6 inches fell at 10 or 12 other stations; the least monthly fall was 1.28 inches, at Dean. Of the total amount that fell at Kansas City, 4.12 inches fell within 24 hours, on the 7-8th; the next greatest 24-hour fall was 2.70 inches. at Lamonte, and Farmington, on the 8th, and 10th, respectively.

WIND.

The prevailing winds were from the south. The average wind movement was 6,278 miles, based upon records of 8 well-placed stations equipped with anemometers. The average hourly velocity was 8.5 miles, or slightly below normal.

SUNSHINE AND CLOUDINESS.

The average number of clear days was 17. The average number of hours of sunshine was 328, or about 74 per cent of the possible and about 11 per cent above normal. This May received about 22 per cent more sunshine than May, 1920, and 5 per cent more than the same month in 1919.

MISCELLANEOUS PHENOMENA.

Auroras—13th, 14th, and 15th.

Fogs, dense—12th.

Frost, light—4th. Frost, heavy—3rd. Killing frost occurred at several stations on the 3rd.

Hail—1st, 7th, 8th, 9th, 10th, and 12th.

Halos, solar—7th, 10th, 12th, 14th, 17th, 18th, 21st, 23rd, 24th, 25th, 28th, and 31st. Halos, lunar—17th and 21st.

Thunderstorms—8th, 9th, 10th, 11th, 12th, 25th, 26th, and 29th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for May, 1921.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXV. COLUMBIA, MO., JUNE, 1921. No. 6.

GENERAL SUMMARY.

June, 1921, in Missouri, was a warm month. The warmth was due to persistently high daily mean temperatures rather than to any extremely high day temperatures alone. While the temperature was 90° or higher on many days, the 100° value was reached only on two days, at two stations.

The steadiness of the heat was the remarkable feature. At Columbia, the section center, the accummulation of temperature from January 1 to June 30 amounted to 1042°, despite the fact that there have been several, though short, cool periods. No other six months of any year since 1888, the beginning of climatological observations, in Missouri, is comparable with this record. The sunshine and wind movement varied but little from their normal values. It was excessively wet in some localities, moderately so in others, and relatively dry in a few.

At the close of the month wheat harvest was farther advanced than usual, the hot weather having forced the grain too rapidly. Corn made fine growth; and pastures and meadows were in satisfactory condition.

TEMPERATURE.

The monthly mean temperature for the State, 66 stations reporting, was 76.6°. The departure from the normal for 62 stations having 10 or more years' record was plus 3.4°. The month was warmer than usual in all sections but the excess in warmth was somewhat less marked in the Ozark Pleateau and Southwest Plain than in the other divisions. From about the 3rd to the 10th, and 22nd to the 27th, temperatures were normal or a few degrees below, but the rest of the month was hot. There were 13 days with temperatures of 90° or higher, but only two stations reported 100° or higher, on three days, the 1st, 13th, and 17th.

PRECIPITATION.

The average precipitation for the State, 83 stations reporting, was 5.71 inches. The departure from the normal for 71 stations having 10 or more years' record was plus 1.15 inches. Precipitation was generally ample, and rather excessive in the southwestern part of the State, including the western part of of the Ozarks. It was, however, less than normal in several of the southeastern counties, one or two of the northeast, and along and north and west of the Missouri River from about Warren to Nodaway County. The heaviest monthly fall was 11.39 inches, at Warsaw. Heavy amounts also fell at Dean, Mountain Grove, Lebanon, Rolla, Springfield, and Nevada. The greatest fall in any 24-consecutive hours was 4.14 inches, at Rolla on the 8th. There were only a few days on which no rain fell, but the heaviest and most continuous spells were probably from the 7th to the 11th, and 22nd to the 28th.

WIND.

The prevailing winds were from the southwest. The average wind movement was 5,352 miles, 7.4 per hour, or about normal. No wind damage was reported.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the records of 6 well placed stations with sunshine recorders, was 304 or about 68 per cent of the possible and about 2 per cent less than normal.

MISCELLANEOUS PHENOMENA.

No hail reported.

Halos, solar.—2nd, 7th, 15th, 20th, 23rd, and 27th.

Halos, lunar.—13th, 20th, 21st, and 22nd.

Thunderstorms, general.—2nd, 7th, 8th, 9th, 10th, 14th, 15th, 19th, 20th, 22nd, 25th, 26th, 27th, and 30th.

The telegraph and telephone services at Poplar Bluff, Mo., were temporarily crippled by an electric storm on the 14th. And a youth, Clarence Schroeder, 16 years old, was struck and instantly killed, at St. Charles, Mo. He was unloading a wagon by the side of a threshing machine. Another man, his companion, was stunned but revived several minutes later.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for June, 1921.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXV. COLUMBIA, MO., JULY, 1921. No. 7.

GENERAL SUMMARY.

July, 1921, in Missouri, was hot relatively dry, with above normal sunshine, and light winds. From the physiological side it was a wearisome month, as there was little or no relief from the almost continuous heat.

While the precipitation was deficient, it was, on the other hand, well distributed, particularly on the days of the most general showers, and resulting crop damage was less marked than usually attends so marked a deficiency.

There were a few hail and windstorms, the damage being confined to small areas. See special notes.

TEMPERATURE.

The monthly mean temperature for the State, 65 stations reporting, was 80.3°. The mean departure from the normal for 61 stations having 10 or more years' record was plus 2.9°. It was the warmest July since 1916. There was an excess of warmth in all sections, but it was somewhat less pronounced in the Ozark Plateau, and Southwest Plain. There was an average of 25 days with maximum temperatures of 90° or higher. Thirty stations recorded 97° or higher, and at twenty-one the values reached 100° or higher. The 12th, 17th, and 30th were the hottest days generally.

PRECIPITATION.

The average precipitation for the State, 85 stations reporting, was 2.32 inches. The departure from normal for 71 stations having 10 or more years' record was minus 1.77 inches. The rainfall was deficient in all divisions, but it was much less marked in the Southwest Plain. The rainfall was in the form of local showers, the most general distribution probably occurring on the 4th, 14th, 18th, 19th, 28th, and 29th. Only nine stations received more than the normal amount, while six received a montly total of less than one inch. Only two stations, Brunswick, and Arcadia, received more than 5 inches. The least monthly amount was 0.43 inch, at Seymour.

WIND.

The prevailing winds were from the south. The average movement, based on records of 8 stations equipped with anemometers, was 4,965 miles or about 6.7 per hour. This is about 7 per cent below normal. Strong local winds occurred in the southeast part of the State on the 31st.

SUNSHINE AND CLOUDINESS.

There were 20 clear, and 8 partly cloudy days. The average number of hours of sunshine was 366, or 81 per cent of the possible and about 10 per cent greater than normal. This is 5 per cent more than July, 1920.

MISCELLANEOUS PHENOMENA.

Fog, dense.—On the 30th.

Hail.—In Nodaway County, on the 6th. (See Notes.)

Halos, solar.—2d, 11th, 12th, 14th, 15th, 17th, 18th, and 19th. Lunar.—12th, 14th, 17th, and 18th.

Thunderstorms, more or les general.—4th, 14th, 18th, 28th, 30th, and 31st. Local thunder occurred frequently.

SPECIAL STORM NOTES.

During the afternoon of July 6th, a severe wind and hail storm passed over Nodaway County from southwest to northeast. At Harmony Center, and Palestine, large and severe hail fell. Hailstones reported to be as large as doorknobs; and ice, a foot thick, remained in creek-beds two days after the storm. Men, and stock caught out in the fields, were considerably battered, being sore and stiff the following day. Out of a flock of 150 chickens, 130 were killed. All windows exposed to the storm were broken; a few roofs were damaged. The damage to crops was severe.

During the afternoon of the 25th, Oscar Wilson, a farmer in the northern part of Boone County, was killed by lightning while pitching oats. He was on the top of the wagon, and the bolt struck him in the head, zigzagged across his breast and passed down the left leg. Other men were working with him, but none was injured.

Strong winds occurred in Dent and adjoining counties, and thence north to St. Louis the afternoon of the 31st. Some minor damage was done.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for July, 1921.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXV. COLUMBIA, MO., AUGUST, 1921. No. 8.

GENERAL SUMMARY.

The weather of August, 1921, was generally warm and humid. The first ten days were mainly slightly cooler than normal. The middle portion of the month was mainly warmer than normal generally. The last ten days were continuously warm, especially in the northwest and southeast sections. Showers were frequent and quite well distributed; on several days they were heavy to excessive, particularly in the southwest section. Taking the month as a whole, the precipitation was ample for needs.

From the side of personal comfort it was a wearisome month; but from the agriculturist's point of view it was quite satisfactory. At the close of the month the early planted corn was practically made, and the late planted was well along toward maturity. Plowing and preparing ground for fall seeding was well advanced; and pastures were generally good.

Some small local damage was done by wind and hail.

TEMPERATURE.

The monthly mean temperature for the State, 65 stations reporting, was 76.8°, or 0.8° above normal, and more than 3° warmer than the same month in 1920. The excess of temperature was slightly more marked in the Northwest Plateau, and in the Southeast Lowlands than in the three other divisions. The first ten days were, as a rule, the most pleasant, while the last ten days were the warmest and most unpleasant. Maximum temperatures of 100° or higher occurred at 12 stations on the 19th and 23rd; and there were 15 days with 90° or higher.

PRECIPITATION.

The average precipitation for the State, 80 stations reporting, was 5.27 inches. The departure from normal for 70 stations having 10 or more years' record was plus 1.63 inches. All divisions show an excess of precipitation, but locally it was somewhat below normal, confined mostly to the southeast part of the State, and in the extreme northwest counties. The most general rains fell on the 1-2d, 6th, 10-11th, 13-14th, 16-17th, and 25-26th. Five stations received a monthly total of 6 to over 9 inches, the greatest amount, 10.04 inches, falling at Marble Hill, 5.20 inches occurring within 24 hours, on the 13-14th. The next heaviest 24-hour amount was 4.22 inches, at Amoret on the 13th.

WIND.

The prevailing winds were from the south. The average movement, based on records of 8 well placed stations equipped with anemometers, was 5,763 miles and about 13 per cent more than the average. There were some strong local winds on a few days.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of six stations equipped with sunshine recorders, was 285, or 67 per cent of the possible and about 5 per cent below normal.

MISCELLANEOUS PHENOMENA.

Hail.—At Kirksville, on the 5th; Palmyra, 6th; Arcadia, 23rd; and Koskonong, 24th.

Halos, solar.—4th, 15th, 21st, and 25th.

Thunderstorms.—1st, 6th, 11th, 13th, 16th, 25th, 27th, and 28th. Thundershowers were frequent.

SPECIAL STORM NOTES.

During a local thundershower the afternoon of August 3, at the County farm, 6 miles north of Princeton, Mercer County, lightning killed three horses, badly injured another, stunned one driver and severely shocked another.

On August 6th, a barn owned by George Palmer, Boone County, was destroyed by lightning. Mr. Palmer was in the barn at the time; he was knocked down and made helpless, but was rescued in time. He later recovered from the shock. Loss about $3000.

On August 29th, a barn owned by David Purdy, Boone County, was struck by lightning and destroyed by fire. Five fine work mules were killed, 1,000 bales of hay, 300 bushels of oats, and 15 barrels of corn were destroyed. Loss about $8000.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for August, 1921.

DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

XV. Columbia, Mo., Year 1921. No. 13.

GENERAL SUMMARY.

In Missouri the year 1921 will long be noted as the all warm year. The year with the highest mean temperature during thirty years or more, and the only one in which all months were above normal temperature.

Other peculiarities of the year include the fact that there were only about 10 typical winter days, that is, days on which the temperature did not rise above 32 degrees in any hour of twenty-four, whereas during a normal winter they number from 25 to 30. During an average year temperatures usually reached 32 degrees or lower on about 116 days; last year there were not as many by 20 per cent. During an average season snow is on the ground from about 30 to 35 days, but last year such days did not exceed 15.

After all the most remarkable feature of the year was the steady and persistent accummulation of warmth. The accummulated excess in temperature from January 1 to March 31 was 742 degrees. By the end of June this amount had increased to 932 degrees, and at the end of the year it was 1,397 degrees. If we include December, 1920, we get 13 consecutive months with an accummulation of 1,477 degrees, or a daily average of nearly 4 degrees. March, with an excess of 264 degrees, leads the months, but February, with its 28 days and excess of 255 degrees, or an average of about 9 degrees a day, was really a more remarkable accummulation of warmth than March shows. This record never has been equaled in Missouri since the beginning of authentic temperature records in 1888.

It was a fair to good year for crops. The abnormally warm winter forced winter wheat beyond its seasonal growth. The late March freeze damaged it somewhat and it was further damaged by the sudden change from cool to hot in May. Corn was damaged in some central and eastern sections through lack of moisture in July, and by local floods in September. The crop as a whole was satisfactory. Nearly all fruits were killed by the freeze at the end of March and about the middle of April.

TEMPERATURE.

The annual mean for the State was 58.2°, or 3.8° above the normal. All months were warmer than normal, the most marked departures occurring in January, February, March, June, September, and December. The accumulation of warmth was uniformly distributed over all sections, but perhaps slightly more marked in northern sections. The extremes, however, did not equal those of other years. The highest temperature was 109°, at Caruthersville, Pemiscot County, on July 17th; and the lowest was −8°, at Bethany, Harrison County, on December 25th.

PRECIPITATION.

The annual precipitation for the State (rainfall and melted snow), was 43.77 inches, or 4.22 inches more than the normal. The greatest local annual amount was 61.33 inches, at Warsaw, Benton County; and the least was 21.48 inches, at Conception, Nodaway County. The greatest local monthly amount was 14.95 inches, in September, at Avalon, Livingston County. No precipitation fell in November at Kidder, Caldwell County, and only a Trace, and 0.03 inch respectively, at Unionville, Putnam County and Appleton City, St. Clair County. March, April, June, August, and September, were the relatively wet months. February, May, and July, were the most noticeable for deficient moisture. The seasonal snowfall was only 11.5 inches, but it was unusually well distributed.

The principal rivers remained well within banks: but some of the smaller streams went out of banks for a short time in April, September, and November, the most damage being confined to the Black River drainage basin.

THE WEATHER BY MONTHS.

January—An unusually mild and pleasant month. The last 10 days were rather cloudy and wet but not cold. A few days about the middle of the month made up the coldest spell. Zero temperature occurred on one day, the 17th, at three stations; and 32° or lower occurred on only 21 days. A general and deep snow fell on the 13th but melted rapidly. Most of the precipitation fell during the last 10 days, and was generally sufficient for needs. Winter wheat fared well. In southern sections fruit buds awakened from their dormant state, indicating premature blooming.

February—Probably the most pleasant winter month in 30 years or more. Precipitation was light and infrequent; and there was much sunshine. The monthly mean temperature was only a few degrees lower than the normal for March. The eastern part of the Ozarks, and southeastern counties were heavily covered with snow on the 19th and 20th. Some delay to transportation was occasioned by depths ranging from 9 to 15 inches. The soil generally was in good condition most of the month. Much plowing was done, and about one-third of the oat crop sown. Winter wheat was in fine condition. The general condition of fruit buds was one month ahead of the seasonal stage.

March—Remarkably mild weather prevailed up to the last three or four days, when there was a sudden change from pleasant warmth to winter cold. During the middle of the month temperatures ranged into the high 80's. During the last four days a hard freeze prevailed, even to the southern border. Precipitation was heavier than normal, and rather more than needed. A general but moderate snow fell on the 27th. All vegetation, including farm crops such as wheat, oats, and alfalfa, was damaged. To fruits the freeze was well-nigh disastrous.

April—Generally mild but wetter than usual. A freeze prevailed on the 17th and 18th, and killed most of the fruit remaining after the March freeze. There was a general snow on the 15th and 16th, preceding the freeze. There was some warm weather during the last 10 days with temperatures ranging from 85° to 91°. The Black River, in the southeastern part of the State, was out of banks during the last week, flooding most of the low lands. Wet soil delayed plowing, and corn planting. Wheat, meadows, and pastures made good growth, but oats made but slow recovery.

May—Cool and showery the first half, changing suddenly to hot and relatively dry. Temperatures of 32° or lower occurred on the 2nd and 3rd; and 102° was recorded on the 23rd. The warmth of the last 10 or 12 days was equal to the normal for the same days in June. Farmers caught up with their work during the drier weather. Wheat improved, but the sudden heat forced head-making. Oats still poor.

June—A warm month, although without any unusually high temperatures. There were 13 days with 90° or higher, but only three days with 100° or higher, at two stations. It was excessively wet in some localities, moderately so in others, and relatively dry in a few. Wheat harvest was further advanced than usual, the hot weather having forced the grain too rapidly. Corn made fine growth.

July—A hot and relatively dry month, with more sunshine than normal. Precipitation was deficient but quite well distributed, particularly on days with the most general showers,

SUMMARY—*Continued from Page 49.*

and resulting crop damage was less marked than usually attends so marked a deficiency. There were a few hail, and wind storms, the damage being confined to small areas.

AUGUST—Generally warm and humid. A wearisome month from the side of personal comfort, but quite satisfactory from the agricultural side. The bulk of the corn crop was well along to maturity by the close of the month; and the preparation of the soil for fall seeding was well advanced.

SEPTEMBER—Excessive precipitation and persistent warmth were the outstanding features. Creeks and small rivers of the central parts of State went out of banks, damaging and destroying considerable corn. Preparing soil for winter wheat was hindered or stopped completely. Much good hay was ruined. Altogether an unsatisactory month on the farm.

OCTOBER—One almost continuous spell of "beautiful weather", the term usually applied by the general public. Highly favorable for outdoor life, and farm work. Heavy to killing frosts occurred locally on the 8th, and 12th, but there was much vegetation still green when the month ended, especially in the central and northern sections.

NOVEMBER—A mild month, with one cold spell, which began on the 10th and ended on the 13th. Temperatures ranged from 10° to 20° above zero. This also was the first general freeze of the autumn. Precipitation was excessive in the southeastern part of the State; and damaging floods resulted from overflows of the Black, Current, and St. Francois Rivers. Winter wheat was in satisfactory condition. Corn was mostly in crib. Pastures very good.

DECEMBER—Exceptionally bright and pleasant, except a touch of real winter from the 20th to the 27th, the outstanding feature being a sleet or glaze storm on the 22nd and 23rd—moderate but steady rain falling while temperatures were several degrees below the freezing value. Live stock was on pastures most of the month. Winter wheat did fairly well, some of the early sown, however, being fly infested.

Description of Evaporation Stations.

Both stations are on University of Missouri grounds, at Columbia, Mo. The "Columbia" station is located 180 feet northwest of Switzler Hall, on the west campus with other equipment of the Weather Bureau office. The "University of Missouri" station is about one mile southeast, on the experimental farm. The "Columbia" station is shaded two hours a day and wind movement is obstructed by buildings and trees; the ground slopes 5 degrees to the north. The "University of Missouri" station is in a large open field; the ground slopes 5 degrees to the south.

The evaporation pans are cylindrical, 48 inches in diameter, 10 inches deep, and are filled to a depth of 8 inches. The "Columbia" rain gage is the 12 inch TB type, the other station has the standard 8 inch type. Both have Robinson anemometers, the cups 6 inches above the rim of the pan. Temperature records are made at the "Columbia" station only. There are no bodies of water near either station. The general topography is rolling with patches of forest trees.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., JANUARY, 1922. No. 1.

GENERAL SUMMARY.

Much of January, 1922, was favorable for outdoor occupations in Missouri. There was more sunshine and less precipitation than usual. Quite a cold spell prevailed for a few days beginning on the 19th, but most of the month was neither unusually cold or mild. Snow was quite general on the 12th, and 13th, and 20th and 21st, the last remaining on the ground for several days. There were a few days with sleet or glaze; and thunder was heard on a few days. There were no strong winds.

Many rural districts housed nearly a summer's supply of good ice. In central and northeast districts ice was from about 6 to 11 inches thick. Winter wheat continued healthy, with good root system, but made less than normal growth; it was covered by snow during the coldest weather. Live stock fared well. All roads were in good condition much of the time.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 29.5° or 0.6° below the normal. The Ozark Plateau and Southeast Lowlands averaged 2° and 1.5°, respectively, colder than normal. The Northwest Plateau was about 2° warmer, and the Northeast and Southwest Plains were less than 1° colder than normal. Relatively cold and mild periods of two or three days duration followed each other quite regularly. On the 3rd, 4th, and 8th day temperatures reached the middle 60's. The 19th, 23rd, and 24th were the coldest days. On the first date seven stations recorded zero or lower, while on the 23rd there were 13, the minimum being −6°. The number of days 32° or lower was 28.

PRECIPITATION.

The average precipitation for the State, 86 stations reporting, was 1.21 inches. The departure from the normal for 72 stations having 10 or more years' record was minus 1.05 inches. Precipitation was deficient in all sections, but it was less marked in the western sections. Precipitation fell at regular intervals, the heaviest amounts falling on the 4th, as a rule. There was rain from the 8th to the 10th, confined mostly to the southeast; snow was quite general on the 12-13th, and 17th to 21st; and rain and snow in the southeast on the 26th. Snow was quite evenly distributed, the average monthly total being about 4 inches. In parts of the Ozark Plateau and Southwest Plain amounts ranged from about 6 to 9 inches. The heaviest single snow, between2 and 4 inches, fell on the 20th. There was no drifting. The ground was bare on the 15th and during the last week, but was generally covered from the 20th to 25th.

WIND.

The prevailing winds were from the southeast. The total number of miles, 8 stations equipped with anemometers reporting, was 7,277, an average hourly velocity of 9.8 miles. There were no strong winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 177, or 58 per cent of the possible, and about 7 per cent above normal. The sunshine this month was 12 per cent more than the same month last year.

MISCELLANEOUS PHENOMENA.

Aurora.—At Columbia on the 18th.

Fogs, dense.—4th, 8th, 9th, 10th, 17th, 18th, and 27th.
Halos, solar.—7th, 10th, 11th, 14th, and 24th.
Halos, lunar.—6th, 7th, 11th, 14th, 15th, 17th, and 19th.
Sleet.—4th, 17th, 20th, and 31st.
Thunder heard.—3rd, 4th, and 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries. ‡‡ Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for January, 1922.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., FEBRUARY, 1922. No. 2.

GENERAL SUMMARY.

February, 1922, in Missouri, was milder than normal in all sections, and drier than usual except in the southeastern counties. From the 2nd to the 20th, barring a touch of winter cold along about the 13th, the weather was mostly bright and pleasant, and favorable for outdoor pursuits. The last five days of the month were rather blustry, wet and cold, and probably the most unpleasant days of the month.

At the close of the month the condition of winter wheat was satisfactory as a whole. Live stock were in fine condition. Fruit buds were normal for the season. Highways were in excellent condition up to the time of the more general precipitation about the 20th; some of the roads were even dusty. The snowstorm of the 28th temporarily interfered with cross-state traffic.

TEMPERATURE.

The monthly mean temperature, based upon the records of 69 stations, was 35.4°. The mean departure from the normal for 67 stations having 10 or more years' record was plus 4.1°. This February is not as mild by about 5° as the same month in 1921, but it is the fifth consecutive February with marked plus departure from normal. The excess in temperature was uniformly distributed over the State. The milder periods prevailed from about the 8th to 11th, 17th to 23rd, and on the 21st and 22nd. Day temperature on the 10th, and 21st and 22nd varied between 70° and 75° generally. The cold periods were 6th and 7th, 12th to 16th, and the last five days of the month. The 13th was the coldest day, but only 15 stations reported zero temperatures and these were confined to the northern half of the State. The 28th was also quite a cold day in Ozark Plateau. The average number of days with temperature of 32° or lower was 22.

PRECIPITATION.

The average precipitation, 85 stations reporting, was 1.79 inches. The departure from the normal for 77 stations having 10 or more years' record was minus 0.44 inch. In the Southeast Lowlands precipitation was slightly more than normal but over the remainder of the State it was considerably below the usual February amounts; the Ozark Plateau received but little more than 50 per cent of the normal. Precipitation was general on the 1st, 22-23rd, and 26th to 28th, largely snow on the last two dates. There was very little precipitation of any kind during the period from the 2nd to the 20th. The only general snow occurred on the 28th, though snow fell at a number of stations on the 26th. The total for the month averaged about 2 inches; the normal is about 6 inches.

WIND.

The prevailing winds were from the northwest. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 8,103 miles, 12 miles an hour, and about 15 per cent above normal. Brisk to high wind occurred on the 22nd but there was no damage.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the records of 6 well placed stations equipped with sunshine recorders, was 192. This is about 63 per cent of the possible and about 9 per cent more than normal. There was about 3 per cent more sunshine than during the same month last year, and that one was considered an exceptionally bright winter month.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---19th, 20th, 21st, and 26th.

Hail.---At Neosho on the 20th; Clifton Hill, Downing, Palmyra on the 21st, and at Macon on the 22nd.

Halos, solar.---8th, 10th, 11th, 14th, 16th, 17th, 19th, 21st, and 25th.

Halos, lunar.---5th, 7th, 8th, 9th, 10th, 12th, 13th, and 14th.

Sleet.---4th. 5th, 25th, 26th, and 28th.

Thunderstorms.---19th, 20th, 21st, 22nd, and 23rd.

OBSERVERS' REMARKS.

Downing.---A barn in this neighborhood was struck by lightning and burned the night of the 20th.

St. Catherine.---February was an extra fine month, but ended cold and stormy. Live stock fared well.

Lockwood.---A very pleasant month. A few oats have been sown.

Neosho.---Thunderstorm with hail on the 20th.

Seymour.---Heavy thunder on the 20th and 27th. Rain on the 20th started with hail.

Amoret.---Fine month. Few oats sown.

Appleton City.---Month rather fine and clear. Roads good, dusty at times.

Lamonte.---Some spring plowing done and some oats sown; wheat does not look healthy.

Warsaw.---Fine weather up to the 20th. Closed cold with driving snow.

Avalon.---Fine month for live stock.

Liberty.---Thunderstorm and hail on the 21st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for February, 1922.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., MARCH, 1922 No. 3.

GENERAL SUMMARY.

Mild and moderately cold spells alternated quite regularly during March. The outstanding feature was the abnormally heavy precipitation. Only one March (1898) has been wetter during 55 years. Most creeks and some of the smaller rivers were out of banks part of the time.

As a whole, the weather of the month was favorable for winter grains, spring pastures, and meadows. Winter wheat stooled well; some bottom lands were damaged by overflows. Fruit buds were healthy, with peach, pear, and plum trees in bloom in southern sections. Owing to saturated soil there practically was no plowing, or seeding of oats.

Overland traffic was unfavorably affected by flooded tracks, washouts, and slides. Country roads across the central parts of the State were almost impassable.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 70 stations, was 45.6°. The mean departure from the normal for 68 stations having 10 or more years' record was plus 1.4°, and about 7° colder than March of last year. While most of the State was warmer than normal there were a few stations in the Chariton Valley, several in the extreme southwest, and 14 or 15 in the Ozark Plateau colder than normal. Cold and warm periods alternated quite regularly, the cold periods, however, lasting only two or three days. The lowest temperatures occurred during the first three days, largely the result of snow covered ground extending over from February. The warmest period prevailed from about the 17th to the 24th when day temperatures ranged from 70° to 80°. The average number of days with temperature of 32° or lower was 11.

PRECIPITATION.

The average precipitation for the State, 87 stations reporting, was 6.46 inches. The mean departure from the normal for 77 stations having 10 or more years' record was plus 3.38 inches. Only one March has been wetter, 7.09 inches, 1898, and one nearly as wet, 6.07 inches, 1897, during 55 years. The precipitation was excessive in all sections though somewhat less marked in the northern border section. Twenty-six stations received monthly amounts of from 7 to over 9 inches; from 10 to more than 13 inches fell at several stations. The greatest amount in any 24 consecutive hours was 4 inches, at Jefferson City on the 10th, and the next greatest was 3.88 inches, at Columbia on the 13-14th. The Grand, Osage, and Meramec Rivers went out of banks during the latter half of the month. There also was some flooding from the lower part of the Missouri River, and in the southeastern part of the State from the Mississippi River.

Snow was general on the 1st, and remained on ground to appreciable depths in all sections, except along the immediate southern border.

WIND.

The prevailing winds were from the south. The average movement, 8 stations equipped with anemometers reporting, was 9,009 miles, or about 13 per cent above normal. Winds of 35 miles an hour or more prevailed on the 4th, 5th, and 14th. In the Blue Valley, Jackson County, a miniature tornado developed during the afternoon of the 5th.

SUNSHINE AND CLOUDINESS.

There were only 11 clear days. The average number of hours of sunshine, 6 well selected stations equipped with sunshine recorders reporting, was 175. This is about 47 per cent of the possible, about 8 per cent below normal, and 12 per cent less than March, 1921.

MISCELLANEOUS PHENOMENA.

Earthquakes.---In Butler and New Madrid Counties thence north to St. Charles County on the 22nd, and 30th.

Fogs, dense.---19th, 27th, and 30th.

Hail.---on the 10th, 13th, 14th, 19th, 23rd, 24th, and 25th.

Halos, Lunar.---8th, and 12th.

Halos, Solar.---16th, 17th, 18th, and 27th.

Sleet.---1st, 7th, 10th, 25th, 28th, 29th, and 31st.

Thunderstorms, more or less general.---10th, 13th, 14th, 18th, 19th, 23rd, 24th, and 25th.

SPECIAL STORM NOTES.

March 5.---A miniature tornado developed about 4.45 p.m. in the Blue Valley district, about 5 miles east of the business center of Kansas City. It broke 37 trolley poles of the Independence street car line, damaged the electric light system and some other property, but no persons were injured.

March 10.---Thunderstorm with hail at Warrenton, and Eldon.

March 13.---Thunderstorm with hail at Nevada.

March 13-15.---Excessive rains in Boone County caused Hinkson Creek and the Perche River to flood and overrun much of the lower lands south of Columbia The M. K. & T. R. R. track was under water, and trains were delayed by washouts and slides. Six valuable beef cattle, owned by one George Sandker were drowned.

March 14.---Strong wind at Brunswick, and hail at Gano.

March 19 and 23.---Hail at Arcadia and Seymour.

March 23.---A severe thunderstorm prevailed from about 9 p.m. to 11 p.m. at Kansas City. Hail fell in the southern part of the city, being particularly heavy in the Country Club, Marlboro and Swope Park districts where the stones were from hazel nuts to walnuts in size. Greenhouses suffered the most. The greatest individual loss was about $2,000; other losses were from $100 to $500.

March 23 and 24.---Hail at Warsaw.

March.---Strong wind at Brunswick. Trees were blown down and some roofs blown off. The telephone service was damaged to some extent.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for March, 1922.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., APRIL, 1922 NO. 4.

GENERAL SUMMARY.

April, 1922, in Missouri, was warmer and wetter than normal in all sections; the warmest since 1915 and the wettest since 1893. Except on the 1st, and 18th, there was little or no freezing weather; on the latter date temperatures were 32° at a number of stations, and there was a heavy deposit of frost but the resulting damage to vegetation which was well advanced, was hardly noticeable.

This April was more marked by storms and floods than ordinary. Severe thunderstorms with wind and hail occurred frequently, the most important of these being mentioned under "Special Storm Notes". Floods were frequent and general over the low lands of most of creeks and smaller rivers, and in the Missouri River below Jefferson City, and the Mississippi River below St. Louis. The Osage River continued in flood for about 52 days, beginning in March

Railway traffic was delayed by soft roadbeds and washouts, while many of the dirt roads in central and southern sections were nearly impassable at times.

As a rule the soil was too wet for preparing for and planting corn, and field work in general was a month behind the average. The weather was favorable for winter wheat, meadows, and pastures, and also tree fruits, and berries.

TEMPERATURE.

The monthly mean temperature for the State, as a whole, 70 stations reporting, was 57.3°. The departure from the normal for 67 stations having 10 or more years' record was plus 1.9°. The first half of the month, except the first day, was mainly warmer than normal; the warmest days, with temperatures ranging from about 80° to 91°, were the 6th, 7th, and 16th. The latter half of the month was mainly cooler than normal; the coldest days, with thermometer readings near or below the freezing value, were the 18th, 19th, and 20th. There was considerable frost on the morning of the 18th and one or two places on the 19th, with temperatures of 32° or lower, but, probably owing to the wet condition of the ground and vegetation, there was very little injury.

PRECIPITATION.

The average precipitation for the State, 89 stations reporting, was 6.21 inches. The departure from the normal for 77 stations having 10 or more years' record was plus 2.42 inches. It was the wettest April since 1893. Normals in the northwestern and southeastern sections of the State were exceeded by small amounts, but in other sections the excesses were noticeable. The heaviest amounts, ranging from about 10 to 14 inches, fell in a relatively narrow strip from about Barton and Vernon Counties northeast to about Callaway and Warren Counties. All together, there were 9 stations with 10 inches or more, and 14 stations with 8 inches or more. Floods in the lowlands of the Grand, Chariton, Osage, and Meramec Rivers were frequent. The Missouri River from Jefferson City to St. Charles was out of banks much of the time, and much land was flooded in counties bordering the Mississippi River in the southeastern part of the State. At Warsaw, Benton County, on the Osage River, flood waters have continued for 52 days, causing much damage to farmers.

Except a short period from the 18th to 23rd, and also 29th and 30th, rains fell every day and on most of the days they were general rains.

WIND.

The prevailing winds were from the southeast. The total number of miles, 8 stations equipped with anemometers reporting, was 8,194, 11 miles an hour and about 11 per cent above the average. Fresh to strong gales were frequent.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well-placed stations with sunshine records reporting, was 228. This is about 59 per cent of the possible and 2 per cent less than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense, mostly confined along the Mississippi and Missouri Rivers, on the 5th, 6th, 8th, and 15th.

Frost, heavy.---18th and 20th. Killing.---locally on the 18th and 19th.

Hail.---Caruthersville, 10th; Brunswick, Clifton Hill, Downing, Goodland, and Marshall on the 16th; Eldon, Mexico, St. Louis, Bethany, and Conception on the 17th.

Thunderstorms.---5th, 7th, 8th, 10th, 13th, 14th, 16th, and 17th.

SPECIAL STORM NOTES.

Springfield.—A tornado made its appearance about 5 miles west of Miller, Lawrence County, Mo., the afternoon of April 10th, and traveled a distance of about 49 miles in a northeast direction across the northwest part of Greene County to about Morrisville, Polk County. It passed near or over the villages of Ash Grove, Phenix, Harold, Luck, and Morrisville. Three persons were killed and 12 seriously injured; 8 residences, 2 shops, and two school houses were demolished, besides many roofs blown off, barns blown down, and trees uprooted. Loss about $100,000.

Maryville.—Nodaway County was swept by storms, having some characteristics of tornadoes, during the afternoon and first part of the night of April 8th. There was considerable damage done to property but no lives were lost.

Monnett.—A severe hailstorm occurred the afternoon of the 16th. The stones were as large as black walnuts; the roofs of many houses were practically ruined; plate glass windows were broken, and there was some serious damage to fruit trees and strawberries.

Appleton City.—Hailstorm night of the 13th damaged trees. Strong winds 8th, 9th, 10th, and 12th.

Seymour.—Severe rain, and tornado-like wind, with hail and semi-darkness, on the 14th.

Seligman.—Wind on the 14th, preceding rain, was a gale that unroofed some houses, uprooted trees, and moved a church from its foundation.

Brunswick.—Heavy wind on the 10th blew trees across the streets, stopping traffic. At 2 p.m. 16th, it hailed for ten minutes; stones large enough to break windows.

Downing.—Heavy hailstorm few miles south of this town on the 16th; many windows broken.

Farmington.—The most destructive hailstorm in years occurred about 9 p.m. of the 16th; broke glass windows in residences and greenhouses.

Warsaw.—Hail on the 17th, and 24th. Destructive hail, wind, and rain storms unprecedented in 24 years. Farm work 60 days behind.

Strong and more or less damaging winds occurred in Webster, and Nodaway Counties on the 8th; Clay, Cooper, Harrison, Worth, and Schuyler Counties on the 9th; Chariton, and Dade Counties on the 10th, and in Barry and Webster Counties on the 14th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F D. No. 5. ‡ Indicates plus.

Daily Precipitation for April, 1922.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., MAY, 1922. No. 5.

GENERAL SUMMARY.

There were no marked or outstanding features about the weather of May, 1922, in Missouri. The month was somewhat warmer and drier than normal, though there were no uncomfortably hot spells, nor was the lack of moisture harmful to vegetation. Excessive heat, while not common in May, has obtained several times in the past 30 years or more. Last May, day temperatures reached 100° or higher at several stations, but this May 90° was the highest, if we except one station in the extreme Southeast, where 97° was recorded one afternoon. On the other hand, the first week of May rarely passes without the occurrence of frost forming temperatures, yet this May was an exception, the lowest temperature being 38°, and no frost.

The rainfall was, upon the whole, rather well distributed through the month, and because of this feature the deficiency, which averaged about 1.77 inches, caused little remark. There were two or three quite heavy local rains but no downpours anywhere.

The month was practically free from damaging storms, although hail caused some minor damage at a few widely separated points.

The weather was, as a rule, favorable for all crops, and field work was well in hand at the close of the month.

TEMPERATURE.

The monthly mean temperature for the State, 69 stations reporting, was 67.2°. The departure from the normal for 67 stations having 10 or more years' record was plus 2.3°. The excess in warmth was quite uniformly distributed but there were no excessively hot days. As a rule the first 13 days were somewhat warmer than normal; the following week was in the main cooler than normal, while the remainder of the month, with the exception of the 31st, was a few degrees warmer than usual. The temperature reached 90° or higher at two stations. In comparison it was a much more pleasant month than May, 1921.

PRECIPITATION.

The average precipitation for the State, 87 stations reporting, was 3.17 inches. The departure from the normal for 78 stations having 10 or more years' record was minus 1.77 inches, and in this respect the month differed but little from May, 1921. The moisture was deficient in all sections, but at the same time it was sufficient for needs. as the preceding month of April was very wet. A few localities, most of them in the northwest section, received normal or above normal amounts. Though light to moderate as a rule, showers fell almost daily in some parts of the State. The heaviest local monthly amount was 6.86 inches, at Oregon, and the least was 1.01 inches, at Poplar Bluff. The greatest amount in 24 consecutive hours was 2.50 inches, at Seligman, Barry County.

WIND.

The prevailing winds were from the southeast. The average wind movement was 6,284 miles, based upon records of 8 well-placed stations equipped with anemometers. The average hourly velocity was 8.4 miles, or slightly below normal.

SUNSHINE AND CLOUDINESS.

The average number of clear days was 14, 3 less than last May. The average number of hours of sunshine was 296, or about 67 per cent of the possible and about 4 per cent more than normal. This May received about 7 per cent less sunshine than May, 1921, and about 15 per cent more than the same month in 1920.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---May 3rd.

Hail.---5th, and 16th.

Halos, solar.---3rd, 4th, 5th, 7th, 8th, 9th, 10th, 11th, 13th, 15th, 17th, and 20th.

Halos, lunar.---2nd, 3rd, 4th, 7th, 8th, 9th, 10th, and 31st.

Thunderstorms.---5th, 6th, 8th, 10th, 11th, 12th, 14th, 16th, 22nd, 23rd, 24th, 25th, 26th, 27th, 30th.

SPECIAL STORM NOTES.

Macon.---Hail fell here on the 5th, but no damage.

St. Catherine.---Hail stones one inch in diameter fell at about 11:55 a.m. on the 6th, and covered the ground. One mile west of this station the hail drifted and was not melted at 12 m. of the following day.

Steffenville.---Hail fell here on the 6th, and 16th.

Seligman.---A heavy rain fell here on the 31st, and washed many fields.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for May, 1922.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., JUNE, 1922. No. 6.

GENERAL SUMMARY.

June, 1922, in Missouri, averaged warmer and drier than normal. The month opened with temperatures generally below normal. The second week showed a marked reversal, the excess from about the 7th to the 17th averaging from 2° to 10° a day; the remainder of the month alternated as short periods of moderate to warm weather, with several hot days, except it was mainly hot along the southern border.

The temperature distribution and accumulation of the present year up to and including June differed markedly from the prevailing conditions for the half year of 1921. At the end of June last year the accumulation exceeded 1,000°, while this year for the same time it is less than 400°.

Moderate local showers occurred occasionally during the first three weeks, but during the last week they were more generous both as to amounts and distribution.

The weather was favorable for harvesting grain and hay and for cultivating corn; the last named crop was favorably affected, except more moisture was needed in the east-central counties. It was reported that the heat during the middle of the month prematurely ripened wheat and shriveled the berry somewhat; and there was some local damage by rust and chinch bugs.

There were no damaging floods or storms of any kind.

TEMPERATURE.

The monthly mean temperature for the State, as determined from the records of 70 stations, was 76.5°. The departure from the normal for 68 stations having 10 or more years' record was plus 3.1°. The warmth of this June differed but little from that of last year, but was nearly 4° warmer than the same month in 1920.

The temperature excess was uniformly distributed. The highest monthly mean was 84°, at Caruthersville, Pemiscot County, and the lowest was 73.3° at Edgerton, Platte County. The 1st, 3rd, and 4th, were quite pleasant days. The 13th, 14th, 23rd, and 24th were the hottest. Caruthersville had 100° or higher on 14 days, with 108° as maximum. Twenty stations had 100° or higher on either the 13th or 14th or 23rd and 24th, some few during both periods. Thermometer readings were 90° or higher on an average of 15 days, ranging from 9 days in the northwest section to 18 in the southeast, and about 16 days from southwest to northeast.

PRECIPITATION.

The average precipitation for the State, 84 stations reporting, was 1.66 inches. The departure from the normal for 78 stations having 10 or more years' record was minus 2.89 inches. In comparison with other Junes the average, 1.66 inches, is the least in 55 years, although 1.67 inches in 1870, and 1.78 inches in 1911, were practically the same.

The deficiency was marked in all parts of the State. There were no excessive local rains anywhere. There were 19 stations with monthly totals of less than one inch, and 6 or 7 with less than one-half inch. The precipitation was in the form of local showers, being perhaps somewhat more frequent and better distributed during the last week.

WIND.

The prevailing winds were from the south. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 5,213 miles, 7.2 miles per hour, or about normal. There were no high winds; except locally in Schuyler, Nodaway, and Dent Counties.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 345 or about 77 per cent of the possible and about 7 per cent more than normal. This June was about 9 per cent brighter than the same month last year.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---3rd.

Hail.---On the 13th, at Hannibal.

Halos, solar.---6th, 7th, 8th, 15th, 17th, 24th, 25th, and 29th.

Halos, lunar.---On the 3rd.

Thunderstorms.---Local 7th, 9th, 10th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 20th, 27th and 29th. More or less general on the 11th, 19th, 24th, 25th, 26th, 28th, and 30th.

OBSERVERS' REMARKS.

Gorin.---Some local damage by wind. Weather generally favorable.

Macon.---Wheat all cut; quality fairly good. Timely showers for corn.

St. Catherine.---A hot month with abundance of sunshine. Corn looks fine; other crops fair.

Warrenton.---Hot, dry weather prevailed most of the month. Vegetation beginning to suffer.

Bolivar.---Very dry month. Grass and gardens damaged, but corn standing the drouth well.

Farmington.---A fine growing month. Very dry up to the 18th; rain sufficient latter part month; moisture opportune.

Gano.---There was a violent electric and rainstorm south of this station on the 25th. Several head of cattle were killed and other damage done.

Lebanon.---Pastures badly hurt by drouth; and corn is beginning to curl.

Lockwood.---A very dry, hot month. Wheat and oats damaged by sun and heat. Corn is small but clean.

Rolla.---Frequent local showers between 25th and 30th. Corn and grass benefited.

Appleton City.---Month hot and dusty with hot winds. Hottest June since 1918. Wheat crop poor; oats almost a failure.

Lamonte.---Wheat and oat harvest finished. These crops were damaged by bugs, reducing the yields but quality is good. Fine crop of hay.

Warsaw.---Driest June in 24 years. Pastures, gardens nearly ruined; berries and tree fruits damaged.

Avalon.---Very dry month, but crops did well. Good honey season.

Maryville.---There was a high wind on the 13th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for June, 1922.

CLIMATOLOGICAL DATA.

AUG 4 1922

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., JULY, 1922 NO. 7.

GENERAL SUMMARY.

July, 1922, in Missouri, was a month of nearly normal warmth, sunshine, and wind. The rainfall resulted chiefly from local showers and thunderstorms, and was of course of irregular distribution. The monthly total, however, was more than has fallen in any other July since 1915. The outstanding feature was the excessive rain of the 10th, 11th, and 12th in northern sections, and resulting destructive floods in the bottom lands of the Grand, Nodaway, Platte, and One Hundred and Two Rivers. It was the worst and most destructive flood since 1909. The damage and in many cases total loss to crops and other property amounted to, as estimated by the press, more than $1,000,000.

Aside from the destructive flood mentioned, the weather of the month was the most favorable for crop development of any July since 1910. At the close of the month the corn crop was in excellent condition generally, save locally in a few eastern counties. Fruit, truck and minor crops, pastures and live stock were generally in satisfactory condition.

There were a few damaging wind storms. See special notes.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 76.8. This is approximately normal. The first 20 days were mainly slightly cooler than normal, while the last 10 were mainly slightly warmer than usual. There were several consecutive hot days during the last week when maxima ranged in the high 90's generally, while locally at about 8 stations 100 and higher were recorded.

PRECIPITATION.

The average precipitation for the State, 86 stations reporting, was 5.85 inches. The departure from the normal for 76 stations having 10 or more years' record was plus 1.82 inches. The month was somewhat drier than normal in most of the east-third of the State but was unusually wet in most of the southwestern and northwestern sections. Excessive and damaging rains occurred over the northwestern plateau during a three-day rain, the 10th, 11th, and 12th. The bottom lands drained by the Grand, Platte, and One Hundred and Two Rivers were badly damaged by the worst flood since 1909. The heaviest totals of this rain storm are given in the following table: (Inches)

July	10	11	12	Total	July	10	11	12	Total
Bethany	6.00	0.27	1.65	7.92	Liberty	1.26	2.05	1.05	4.36
Chillicothe	1.40	1.93	1.38	4.71	Maryville	10.82	0.18	0.73	11.73
Downing	3.40	1.45	1.41	6.26	St. Catherine	1.45	1.85	1.45	4.75
Grant City	12.25	0.25	1.36	13.86	Trenton	3.34	0 65	2.34	6.33
Kirksville	1.94	1.85	1.84	5.63	Unionville	2.50	1.90	1.10	5.50

The flood condition in the northern section was further augmented by heavy rain on the 17th, as follows: Brunswick, 3.10; Clifton Hill, 2.57; St. Catherine, 4.55, and Trenton, 4.45 inches. The greatest falls in any consecutive 24 hours were 12.25 and 10.82 inches at Grant City and Maryville, respectively, on the 10th.

WIND.

The prevailing winds were from the south. The average movement, based on records of 8 well placed stations equipped with anemometers, was 5,580 miles, and about 4 per cent more than the average. There were some local high winds on the 9th, 11th, and 29th. Damage was confined to small areas.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 stations equipped with sunshine recorders, was 223, or about 72 per cent of the possible and about normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---At Kansas City on the 26th.

Halos, solar.---2nd, 6th, 9th, 11th, 12th, 16th, 17th, 18th, 20th, 21st, 22nd, 23rd, 24th, and 29th.

Halos, lunar.---On the 31st.

Thunderstorm.---On the 1st 6th, 7th, 10th, 11th, 12th, 17th, 23rd, 25th, 29th, and 30th.

SPECIAL STORM NOTES.

July 10-12th. Period of excessive rainfall, severe thunderstorms and damaging squall winds, probably most severe night of 10th. At Kansas City, trees or heavy boughs falling on telephone and electric light lines broke down over 8,000 poles; 25 street cars were stalled because of burned out motors; streets and basements were flooded in low places. Estimate of damage about $35,000. The extreme wind velocity was 56 miles from the northwest. Maryville reported 10.82 inches rainfall from 3.30 p.m. of 10th to 7 a.m. of 11th; Grant City reported 12.25 inches before 6 p.m. of the 10th. Very destructive floods in One Hundred and Two, Platte, Nodaway, and Grand Rivers, together with all the many western and central tributaries of the latter. Statistics of the flood damage are not yet compiled.

July 16-17th. St. Catherine reported over four inches rainfall in one hour on the morning of the 17th. Near Lancaster, 1,000 feet of railway track was washed out and an extra freight engine ran off at the break. At Downing and Amoret barns were struck by lightning and burned. Local damage to growing crops were reported over wide areas.

July 23rd. At Birds Point, near the ferry landing, a man was killed by lightning.

July 29th. Minor damage at Kansas City during severe thunder squall. Branches of trees were blown on telephone and lighting equipment and many poles broken down. At Columbia, trees and heavy boughs blocked streets and caused quite general interruption of lighting and telephone service for 24 hours. Three women were seriously injured by a tree falling on the car in which they were driving. Several plate glass store fronts were broken; the green houses suffered heavily; haystacks, windmills, etc., were blown down. Damage occurred over 100 square miles.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem. R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for July, 1922.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., AUGUST, 1922. No. 8.

GENERAL SUMMARY.

August, 1922, was mainly warmer and drier than normal. Droughty conditions were more pronounced in the southwestern plain than in other divisions, and the heat was less marked in the Ozark Plateau. Temperatures fluctuated, some times a little above and again a little below normal, during the first 12 days and the last week, but in between these dates the weather was continuously hot.

Rain fell as local showers, and was rather scanty in the east-third of the State from about Pike County south to the southern border, and in the southwestern plain. The more or less general showers on the 1st, 16th, 21st, 22nd, and 30th prevented much damage to vegetation.

The weather of the month was mostly favorable for crop growth and outdoor work; corn showed little harm from dryness, except some late planted, and upland corn was damaged in the southwestern plain by hot winds during last decade, and by lack of moisture and heat along the eastern border. Plowing for fall seeding made good progress.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 70 stations reporting, was 77.5°. The departure from the normal for 67 stations having 10 or more years' record was plus 1.2°. The warmth was variable during the first 10 or 12 days and the last week, the departures from normal being small, but from about the 15th to the 24th, inclusive, the weather was continuously and markedly warm; afternoon temperatures reached the 100° value at about 50 stations, the maximum being 107°, at Hollister on the 24th, the hottest day generally, though a good many stations recorded 100° readings on more than one day.

PRECIPITATION.

The average precipitation for the State, 87 stations reporting, was 2.40 inches. The departure from the normal for 78 stations having 10 or more years' record was minus 1.60 inches, and the largest deficiency for any August since 1913. Moisture was deficient in all divisions but the departure from normal was relatively small in the northwestern plateau; in the southwestern plain the lack of moisture was noticeable, averaging about 2.23 inches less than the usual August rainfall. The deficiency also was quite marked at several of the east-central stations. Nine stations confined to the western border and southern sections, received less than one inch, the least monthly amount being 0.13 inch, at Bolivar. The rainfall was mostly light to moderate local showers, except it was rather more general on the 21st, 22nd, and 30th. The greatest amount in any 24 consecutive hours was 3.87 inches, at Vanduser, Scott County, on the 22nd.

WIND.

The prevailing winds were from the south. The average movement, based upon records of 8 well placed stations equipped with anemometers, was 5,075 miles, or about 6.8 miles an hour. This is about normal. There were a few thunderstorm squalls.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of six well placed stations with sunshine recorders, was 312, or 74 per cent of the possible and about 3 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—On the 23rd and 27th, at St. Joseph.
Halos, solar.—2nd, 3rd, 6th, 21st, 26th, 28th, and 31st.
Halos, lunar.—On the 3rd.
Thunderstorms.—1st, 6th, 15th, 16th, 17th, 18th, 20th, 21st, 22nd, 26th, 29th, 30th, and 31st.

OBSERVERS' REMARKS.

Downing.—During night of the 20th two valuable Hereford cows in the herd of Henry Cook & Sons were killed by lightning. Corn crop fine, and practically made.
Gorin.—Some hot days but generally favorable.
Macon.—Big fruit crop assured. Corn in splendid shape.
St. Catherine.—The month has been rather hot; crops are good.
Vanduser.—More melons shipped from this section than ever before.
Bolivar.—Very hot and dry; vegetation badly damaged.
Farmington.—A hot and dry month; crops suffered.
Lebanon.—Corn is about ruined by dry weather.
Lockwood.—A hot and dry month; hot winds damaged corn crop.
Seligman.—Hot winds prevailed 22nd to 25th, and late crops suffered.
Seymour.—Hot winds prevailed on the 24th.
Appleton City.—Month hot and dry; hot winds bad on corn.
Lamonte.—Very dry; corn damaged.
Warsaw.—Quite severe drought prevailed latter half of month.
Avalon.—All crops doing fine.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F. D. No. 5.

Daily Precipitation for August, 1922.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., SEPTEMBER, 1922. No. 9.

GENERAL SUMMARY.

September, 1922, was the fourth consecutive month of its name that has been characterized by excessive warmth. The month opened with high temperatures and rather unusual heat persisted during the first 8 or 9 days, the afternoon maxima reaching and exceeding the 100 degree value at more than half the number of stations on several days. The last three days also were unusually warm.

Unlike the past several Septembers, this month was relatively dry, save in the central and western parts of the State. In the southwestern plain up to about the 11th, and in most of the Ozarks and southeastern lowlands during most of the month droughty conditions persisted, happily, however, being occasionally relieved by beneficial showers. Thunderstorms were less frequent than the usual, and, in fact, the type that did occur this month may be classed as thundershowers rather than thunderstorms, as there were few if any attended by damaging squalls.

The dryness caused some deterioration of late planted corn and other late crops, meadows and pastures, along the eastern border and over the greater part of the southern half of the State. The bulk of the corn crop was fairly well made before the lack of moisture was much felt. Plowing made good progress in most of the principal wheat growing counties.

TEMPERATURE.

The monthly mean for the State, based upon the records of 70 stations, was 71.7°. The departure from the normal for 67 stations having 10 or more years' record was plus 2.6°. The first nine days were noticeably warm, the daily excess averaging from 6° to 16°. The following week, beginning with the 10th, was mainly moderate. This in turn was followed by a cool spell, terminating in light frost values on the morning of the 27th; moderate summer warmth prevailed the last three days. During the first week thermometers registered 100° or higher at 40 stations on one or more days, though generally on one day, the 1st, 2nd or 7th. In the southwestern plain --- the most droughty section up to the 11th --- there were five days with 100° or higher.

PRECIPITATION.

The average precipitation for the State, based upon the records of 83 stations, was 3.31 inches, or 0.57 inch below the normal, as determined from 70 stations having records for 10 years or more. Precipitation of the month was unevenly distributed, being deficient along the eastern border, in the Ozarks, and in a few of the north-northeast counties. It was very dry in the southwestern plain up to the 11th, but after that date heavy rains fell, giving a large excess for the month. In the eastern part of the Ozarks and in most of the southeastern lowlands the month was one of the driest of its name on record. The most general rain fell on the 9th and 10th, and also the heaviest, although some heavy local rains occurred on other dates. Monthly totals of from 2 to 5 inches fell at 7 stations in the northeast plain, 8 in the southwest plain, and 6 in the northwest plateau. The greatest amount was 8.22 inches, at Harrisonville, 5.36 inches falling during one rainstorm, on the 3rd.

WIND.

The prevailing winds were from the south. The total number of miles, as determined from records of 8 stations equipped with anemometers, was 5,207, or an average hourly velocity of 7.2 miles. This is about 8 per cent less than normal. There were no damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine records reporting, was 289, or about 78 per cent of the possible, and about 13 per cent greater than normal. September, 1921, had 18 per cent less sunshine than the present month.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---20th, and 21st.
Frosts, light.---In a few low places on the 27th.
Hail.---At Liberty on the 3rd.
Thunderstorms.---2nd, 3rd, 4th, 9th, 10th, 16th, 18th, and 19th.

ERRATA.

August, 1922, report, page 30, Kansas City monthly mean temperature should be 78.7; departure plus 2.9; page 32, maximum on the 30th should be 81; mean maximum, 88.1.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean. Anderson: of Gano. Salem, R. F D. No. 5.

Daily Precipitation for September, 1922.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., OCTOBER, 1922. No. 10.

GENERAL SUMMARY.

The weather of October, 1922, was about ideal for outdoor pursuits. Nearly all the month steady warmth prevailed in all sections of the State. The first week and the final days of the month were summer-like, the afternoon temperatures ranging between 80° and 90° generally.

On the morning of the 12th temperatures approximated the light and heavy frost values, and about a week later, on the 17th and 18th, killing frosts occurred at most stations, the exception being in the immediate vicinity of the larger cities, and in the southeastern part of the State. There was no damage as all crops had matured.

There were relatively few cloudy days. The precipitation was considerably less than normal, but was fairly well distributed, and fell on one or two days at a time at about seven-day intervals. The rains were timely and beneficial; at the same time outdoor work was only temporarily interfered with. In a few southwestern counties water had to be hauled some distance for drinking and other purposes.

Farm work was about completed, except the cribbing of corn which was well underway at the close of the month. Wheat seeding was practically finished. Pastures were green and stock grazing was general, except in the southern-third of the State where pasture lands had failed because of a lack of sufficient rain.

TEMPERATURE.

The monthly mean for the State, based upon the records of 69 stations, was 59.9°, or 2.4° above the normal as determined from 67 stations having records of 10 years or more. The month was one of fine, open weather, and the fifth consecutive October with mean temperature above the normal. Temperatures were uniformly distributed, all sections having practically the same plus departures.

The first six and last seven days of the month were characterized by summer-like warmth, the average daily excess ranging from 9° to as much as 20°. Afternoon maxima were in the high 80's generally, and 90° or higher occurred at 44 stations during the first week. There were only two short cold snaps. The first occurred on the 12th, when the first light to heavy frost occurred, but as a rule, confined to the central part of the State. On the 17th, and 18th, the first killing frosts and moderate freeze occurred, except at a few stations in the extreme south-central and southeastern borders, and within the influences of the larger cities.

PRECIPITATION.

The average precipitation for the State, 87 stations reporting, was 2.00 inches. The departure from the normal for 81 stations having 10 or more years' record was minus 0.77 inch. The precipitation was less than usual in all sections, but the deficiency was less marked in the northwestern plateau. General rains, varying in amounts from light to heavy, fell on the 6th, 7th, and 8th; light rain fell about the middle of the month, and again on the 22nd or 23rd, and the 31st, about seven days intervals, but at the same time only temporarily interfering with outdoor work.

The greatest monthly amount was 3.83 inches, at Grant City, and the least was 0.51 inch, at Seligman. The greatest amount in any 24 consecutive hours, was 3.00 inches, at Goodland on the 7th.

WIND.

The prevailing winds were from the south. The average monthly movement, 8 stations equipped with anemometers reporting, was 5,700 miles, or an hourly velocity of 7.5 miles. Except about 40 miles an hour at Kansas City on the 16th, there were no damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 well placed stations equipped with sunshine recorders, was 249. This is about 72 per cent of the possible, and about 6 per cent above normal, 4 per cent less than in October, 1921, and 28 per cent more than occurred in October, 1920.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---1st, 2nd, 10th, 15th, 16th, 19th, and 24th.

Frost, heavy.---12th, 18th.

Frost, killing.---On the 17th and 18th, except about 7 stations, the larger cities and in the extreme southeast.

Halos, solar.---1st, and 13th. Lunar.---1st, 2nd, 27th, and 31st.

Thunderstorms.---6th, 14th, 22nd, and 31st.

OBSERVERS' REMARKS.

Downing.---A month of ideal weather.

Gorin.---Warm and dry.

Kirksville.---Fine month; warm and dry with much sunshine.

Macon.---Corn and apple crops about gathered. Pastures dry.

St. Catherine.---October was a beautiful month of sunshine and clear skies.

Warrenton.---Fine autumn weather.

Farmington.---Fine weather all month. The last week was quite warm.

Greenville.---The ground is very dry and we are needing rain very much.

Lockwood.---A very dry and warm month. Fall plowing is delayed. Pastures dried and stock water very scarce. Wheat is very small and needs moisture very badly.

Rolla.---Unusually warm and dry.

Seligman.---This section extremely dry; wells and springs drying up. Many hauling water.

Lamonte.---Farmers busy gathering corn; 20 to 25 per cent in crib. Quality generally fair to good. 75 per cent fall plowing done. Wheat looking good.

Warsaw.---One of the most beautiful Octobers ever known in this section and all farm work has progressed. Wheat looking fine but not much acreage. Corn fair to good.

Avalon.---A remarkable fine month; very warm and pleasant. Favorable for farmers. Fine rain on the last day which was much needed.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ª, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for October, 1922.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., NOVEMBER, 1922. No. 11.

GENERAL SUMMARY.

In Missouri nearly the whole month of November was mild and pleasant. There were more bright, sunshiny days than usual, and the wind movement differed only slightly from normal. Many of the afternoons during the first week were summer-like in warmth; and there were but few days during the month that called for heavy clothing. The weather of both October and November, about 61 days, was of considerable economic value to the people of Missouri. The demands for fuel were light; live stock did well on pasture, and much farm work as well as a large amount of house building was done.

The month's total precipitation was moderate to large, but fell on about 7 or 8 days, and these were largely confined to the first half of the month. The Grand River, following quite heavy rains from the 11th to the 13th, went out of banks, flooding the lowlands for a short time, but the resulting damage was relatively small. The Missouri River and most of its tributaries remained well within banks.

Winter wheat stooled fairly well and the condition and progress of the crop at the end of the month was satisfactory. Cribbing corn was completed in most sections. Pastures furnished good grazing and live stock entered the winter in good condition.

TEMPERATURE.

The monthly mean for the State, based upon the records of 69 staitons, was 47.8°, or 2.9° above the normal, as determined from 66 stations having records for 10 years or more. It was the warmest November since 1916. The excess warmth was evenly distributed over all sections, ranging from about 2° a day in the Ozark Plateau and southwestern plain to slightly more than 3° in the other sections. Warm and cool spells alternated quite regularly, the former persisting for several days to a week, while the latter, as a rule, covered about two or three days. There was no very cold weather, the 21st, and 25th being the coldest days, when the minima ranged from about 16° to 26°. During the first three or four days the afternoon temperatures ranged between 70° and 80° quite generally.

PRECIPITATION.

The average precipitation for the State, 87 stations reporting, was 3.82 inches. The departure from the normal for 81 stations having 10 or more years' record was plus 1.45 inches. The precipitation was favorably distributed. save in parts of the northwest plateau where there was rather too much. All sections received amounts greater than normal, the southeastern lowlands being less pronounced in this respect. Most of the precipitation fell during the first 15 days. Though the precipitation was considerably more than usual, there were but 7 rainy days, and but 8 cloudy days. Altogether it was favorable for outdoor occupations. The greatest monthly fall was 6.75 inches, at Dean, McDonald County. The greatest 24-hour fall was 3.40 inches, at Palmyra on the 12th. The Grand River was in flood following the rains of the 11th, 12th, and 13th, but no extensive damage was reported.

Snow flurries fell on the 26th, confined to the eastern part of the State, from about Pike to Mississippi County.

WIND.

The prevailing winds were from the southwest. The monthly movement, 8 stations equipped with anemometers reporting, was 7,363 miles. The average hourly velocity was 10 miles, a little above the monthly normal. Brisk to strong winds occurred on the 1st, 5th, and 27th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well selected stations equipped with sunshine recorders reporting, was 186. This is about 62 per cent of the possible, and about 5 per cent more than normal.

MISCELLANEOUS PHENOMENA.

Fog, dense.---3rd, 9th, and 21st.
Halos, solar.---3rd, 9th, 16th, 23rd, 25th, and 26th.
Halos, lunar.---2nd, 29th, and 30th.
Thunderstorms.---1st, 5th, 6th, 11th, 12th, and 13th.

OBSERVERS' REMARKS.

Downing.---The remarkably mild weather of the month has caused a great saving of fuel and also of feed for live stock.

Kirksville.---The ground was frozen several times during the month but not during the last week.

Macon.---Corn mostly all in and quality fair and good. Weather all month was wonderful; slight rain helped materiallly.

St. Catherine.---November was very nice for general fall work.

Warrenton.---First snowfall was on the 26th; only a trace. Generally fine weather.

Farmington.---Fine fall weather throughout.

Lockwood.---A very open month with good rains. Wheat is looking good and blue grass pastures are good. Corn shucking well advanced. Conditions for plowing are good.

Appleton City.---Roses blooming out of doors during the month. Month very favorable for out door work. Roads dusty first part of month.

Clinton.---Very mild November.

Lamonte.---Wheat looks good. Farmers are pretty well caught up with their work. Ninety per cent of corn in crib.

Warsaw.---The month was ideal for farm work and all classes are far advanced. Wheat looking fine; but acreage is small. Corn mostly gatherered and good quality.

Avalon.---Very favorable for the farmers. Wheat doing fine; pastures still fair. Corn all gathered; good crop.

Chillicothe.---Grand River out of banks.

Tarkio.---Month characterized by mild and pleasant weather.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for November, 1922.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVI. COLUMBIA, MO., DECEMBER, 1922. No. 12.

GENERAL SUMMARY.

December, 1922, in Missouri, as in 1920 and 1921, was mostly bright and pleasant. Notwithstanding some occasional precipitation spells sunshine was 60 per cent of the possible, or about 12 per cent above normal. Except a real touch of winter cold during the second decade, temperatures were nearly ideal for outdoor work and field sports. The cold spell, terminating about the 18th, was followed by mild, pleasant weather to the end of the month. On Christmas Day temperatures were between 60 and 70 generally---the warmest December 25th since 1889.

Winter wheat was seeded under favorable conditions in the early autumn. There has been sufficient moisture for needs, and at the end of this month stands were fine, and color good. Live stock were on pasture most of the month. Nearly all corn has been cribbed. Fruit buds are healthy.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 69 stations reporting, was 36.3°. The departure from the normal for 65 stations having 10 or more years' record was plus 2.9°. It is the third consecutive December with marked plus departures. The excess in warmth was quite uniform and marked in all sections, except perhaps in the northeastern plain where it was less than 2°. The month was made up of two mild periods, 1st to 7th, and 21st to the 31st, and one rather cold period, from the 8th to the 20th. Real cold weather prevailed from the 11th to the 18th. Beginning about 7 p. m. of the 11th and for about 90 consecutive hours the temperatute did not rise above 32° in central and northern sections. On the 12th, 15th, and 18th zero or lower was recorded at 26 stations on one or more days. There were no zero temperatures south of the Missouri River. There were 24 days with 32° or lower.

PRECIPITATION.

The average precipitation for the State, as determined from the records of 87 stations, was 2.11 inches. The departure from the normal for 78 stations having 10 or more years' record was minus 0.14 inch. It was drier than usual in the northern half of the State and southwest plain, and somewhat wetter in the Ozark Plateau and southeastern lowlands. Outdoor occupations were interfered with the first 7 or 8 days in the eastern Ozarks and southeast section, and again more generally from the 27th to the 31st. The snowfall of the month was light and local, and of no consequence. The greatest monthly precipitation was 5.25 inches, at Doniphan. The greatest fall in any 24 consecutive hours was 3.04 inches, at St. Louis on the 26th and 27th.

WIND.

The prevailing winds were from the south. The average monthly movement was 7,612 miles, or an hourly velocity of 10.4 miles. Rather strong winds prevailed on two days, the 11th and 27th.

SUNSHINE AND CLOUDINESS.

The average number of sunshine hours for the State as a whole, was 174. This is about 60 per cent of the possible, and 12 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---2nd, 4th, 6th, 7th, 14th, and 29th.
Hail.---At Clinton, on the 30th. No damage.
Halos, solar.---3rd, 8th, 9th, 11th, 12th, 15th, and 30th.
Halos, lunar.---4th, 5th, 11th, 28th, 29th. and 30th.
Sleet, light.---13th, 14th, 21st, and 30th.
Thunderstorms.---4th, 6th, 26th, 27th, and 30th.

OBSERVERS' REMARKS.

Downing.---A remarkable fine December. Cattle still on grass, saving a lot of feed stuff. Some wells dry and rain is needed on that account.

Macon.---One of the finest Decembers known in recent years.

St. Catharine.---December was an ideal month. Fine for outdoor work. Live stock did well on pasture.

Farmington.---December was a month of pleasant weather with almost no snow. Warmest Christmas in many years.

Lockwood.---A nice winter month. Live stock on pasture. Wheat in good condition. All outdoor work up; some plowing.

Rolla.---December was unusually open and mild.

Appleton City.---The warmest Christmas in many years. Roads in good condition, and dusty part of the month.

Clinton.---Fine month. Severe thunder and hail storm on the 30th. No damage.

Warsaw.---December has been an ideal winter month for work and travel. Warmest Christmas in many years. Snow is needed for wheat.

Avalon.---Unusually dry, fine month. Favorable for live stock. Good crop of corn; all cribbed.

Bethany.---Unusually mild and open December. Roads in fine condition.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for December, 1922.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. ‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. T. Trace, or less than 0.01 inch. *** Regular Weather Bureau station; precipitation is for 24-hour period, midnight to midnight. ** Precipitation in the next following measurement. ‡ Separate dates of fall not recorded.

Daily Temperatures for December, 1922.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXVI. Columbia, Mo., Year, 1922. No. 13.

GENERAL SUMMARY.

The outstanding weather features of the year 1922, in Missouri were a comparatively open winter with light snowfall; an unusually wet March, with some local flood damage; favorable spring for fruits and grasses; excessively heavy rains in July over the northern half of the State and resulting destructive floods in the northwestern section; a rather fine summer, though with some persistent local drought along the eastern border, and in the extreme southwest; an unusually hot September, and a mild and prolonged growing season into late autumn.

The weather of October and November, and most of December was about ideal for outdoor pursuits, and consequently of much economic value to the people of Missouri. The demands for fuel were light; live stock did well on pasture; much farm work as well as a large and necessary amount of house building was done, and besides, the public highways probably were never in better condition.

Outside of the destructive river floods in the northwestern section in July, and some local drought damage, it was a fair to good year for crops. Most tree fruits, and berries were unusually fine and plentiful.

TEMPERATURE.

The annual mean for the State was 56.8°, or about 2.0° above the normal. January and July averaged nearly normal; all other months were warmer than normal. The highest temperature was 108°, at Caruthersville, Pemiscot County on July 14th, and the lowest was —6°, at Fayette, Howard County and Mexico, Audrain County, on January 23rd, and at Downing, Schuyler County, December 18th. In July only 8 stations recorded 100° or higher; in August, 50, mostly on the 24th, and in September there were 40.

PRECIPITATION.

The annual precipitation for the State (rainfall and melted snow), was 39.99 inches, or 0.16 less than normal. January, February, May, June, August, September, October, and December were drier than normal, the last month being noticeably so; the other three months were wetter than normal, March being the most marked in this respect. The greatest local annual amount was 56.59 inches, at Warsaw, Benton County, and the least was 29.15 inches, at the St. Louis University. The greatest local monthly amount was 17.68 inches, at Grant City, Worth County, in July. There was no precipitation at Grant City in December and less than one-fourth of an inch at several other stations. The greatest amounts that fell in any 24 consecutive hours were 12.25 and 10.82 inches, at Grant City and Maryville, respectively, on July 10th. There were some few quite heavy local snows, but the season's average was little more than 8 inches.

THE WEATHER BY MONTHS.

January.—Except a cold spell along about the 19th to the 24th, with some zero temperatures, and a few days with appreciable snow or sleet, the month was mostly bright, and favorable for outdoor work. Precipitation was deficient in all sections but the dryness was most marked in the western parts. Winter wheat continued healthy, with a good root system. Live stock did well. Fruit buds were not injured in any manner.

February.—Barring a touch of winter cold along about the middle of the month, and wet, blustry weather the last five days, February was mostly bright and pleasant. The 13th was the coldest day, but only about 15 stations reported zero temperatures. The month was drier than usual; two appreciable snows fell, the 26th, and 28th, the latter storm interfering somewhat with cross-state traffic. Winter wheat continued in satisfactory condition. Fruit buds were normal. Highways continued in excellent condition up to the 20th.

March.—Mild and cold spells alternated quite regularly. The outstanding feature was the abnormally heavy precipitation. Most creeks and some of the smaller rivers were out of banks. As a whole the weather was favorable for wheat and grasses. Owing to saturated soil there was little plowing for or sowing oats. Overland traffic was unfavorably affected by flooded tracks, washouts, and slides. Country roads were almost impassable. Fruits well advanced.

April.—The month was warmer and wetter than normal. Except the 1st, and 18th, there was little or no freezing weather. The frost of the 18th did no damage. The month was marked by storms and floods, most of the smaller streams were out of banks, and for a short time the Missouri below Jefferson City was in flood. Railway traffic was delayed by soft roadbeds and washouts, and most of the country roads were nearly impassable. Wheat, grasses, and fruits did well. Preparing for corn planting and other farm work was a month behind the average.

May.—Somewhat warmer and drier than usual but there were no outstanding features about the weather of May. The rainfall was well distributed. The weather was, as a rule, favorable for all crops, and field work was well advanced. Except a few local hailstorms, there was no storm or flood damage. All fruit trees were heavily loaded with blossom. Berries were particularly favored by the month's weather.

June.—Somewhat warmer and drier than normal, but on the whole favorable for outdoor pursuits. Moderate local showers occurred the first three weeks, changing to heavier and more general rains the last week. Excessive heat about the middle of the month prematurely ripened some wheat, but most crops and outdoor work were favored by the prevailing weather. There were no damaging storms.

July.—About normal as to warmth, sunshine, and wind, but wetter than usual. A marked feature was excessive rain 10th to 12th over the northern half of the State, which caused the Grand, Platte, One Hundred and Two Rivers, and other smaller streams, to go ont of banks, resulting in the worst and most destructive flood in that section since 1909. Aside from the destructive flood, the weather of the month was the most favorable for crop development of any July since 1910.

August.—Mainly warmer and drier than normal. Droughty conditions were quite pronounced in the southwestern plain and in many of the east-central counties. Some late planted, and some upland corn was damaged by hot winds and lack of moisture. From the 15th to the 24th the weather was hot, the afternoon temperatures reaching 100° or higher daily. For most corn it was good maturing weather. Considerable fall plowing was done.

September.—The outstanding features were excessive warmth and relatively scanty precipitation. The first 8 or 9 days were unusually warm, 100° or higher being recorded on several days. Drought and hot winds caused some deterioration in all late planted crops, meadows and pastures in eastern and southern sections. The bulk of the corn crop was about made before the lack of moisture was much felt. Plowing for wheat made good progress. Highways very good.

(Continued on Page 53.)

Letters of alphabet indicate number of days missing from report: thus [a] one day; [b] two days, etc.

SUMMARY—*Continued from Page 49.*

OCTOBER.—Nearly steady warmth prevailed all month, the first and last weeks being summer-like. In most sections the growing season was closed by heavy to killing frosts on the 12th, 17th, and 18th, but there were some localities in the east and south where there was no freeze at all. Precipitation was less than usual but it was well distributed and sufficient for needs. Altogether an ideal month for outdoor pursuits. The usual farm work was well up. Roads fine.

NOVEMBER.—Nearly the whole month was mild and pleasant. Many afternoons during the first week were summer-like. The month's precipitation was moderate to large, but fell on 7 or 8 days, being mostly confined to the first half. The Grand River was out of banks for a short time. Winter wheat started off well. Live stock remained on pasture. All farm work was well in hand. Highways in good condition.

DECEMBER.—Except a touch of real winter cold during the second decade, December was a pleasant and open month. On Christmas Day temperatures ranged between 60° and 70° generally, being the warmest Christmas since 1889. Winter wheat, having been seeded under favorable autumn conditions, looked healthy and made satisfactory progress. Live stock remained on pasture much of the time. Fruit buds were healthy. Highways generally excellent.

Comparative Annual Data for the State.

Notes and Comparative Data on Evaporation at Columbia, Mo.

There are two evaporation stations. One is located on the West Campus, northwest of Switzer Hall, which we will refer to as No. 1. It is nearly surrounded by houses and trees which make wind-breaks. The other station, which we will call No. 2, is located in a field of the Experiment Farm, about one mile southeast from Station No. 1. It has a free exposure, favorably comparing with what is called sea horizon. Equipments are the same except the rain gage at Station No. 1 is a 12-inch funnel, T. B. The one at Station No. 2 is an 8-inch funnel, stick measurement. Temperatures are taken at Station No. 1 only. For full description of stations see Missouri Annual Summary, 1919, page 100.

Normal rainfall, 32 years, 7-year period.	21.16 “	11.03 “	....	....
Total wind movement for 7-year period.	32,347 miles.	13,153 miles.	76,354 miles.	35,133 miles.
Average wind movement for 7-year period.	4,621 “	1,879 “	10,908 “	5,019 “

Six months period, May to October.

Evaporation of Station No. 1 is 78 per cent of evaporation of Station No. 2.

Rainfall of Station No. 1 is 101 per cent of rainfall of Station No. 2.

Wind movement of Station No. 1 is 42 per cent of wind movement of Station No. 2.

Three-months period, June to August.

Evaporation of Station No. 1 is 84 per cent of evaporation of Station No. 2.

Rainfall of Station No. 1 is 86 per cent of rainfall of Station No. 2.

Wind movement of Station No. 1 is 37 per cent of wind movement of Station No. 2.

Three months evaporation at Station No. 1 is 66 per cent of 6 months evaporation.

Three months evaporation at Station No. 2 is 62 per cent of 6 months evaporation.

Three months of rainfall at Station No. 1 is 43 per cent of 6 months rainfall.

Three months of rainfall at Station No. 2 is 42 per cent of 6 months rainfall.

Three months wind movement at Station No. 1 is 41 per cent of 6 months wind movement.

Three months wind movement at Station No. 2 is 46 per cent of 6 months wind movement.

The rainfall for the 7 years averaged 0.76 inch more than the 32-year normal for the same months, but the summers — June to August — averaged drier by 1.57 inches.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., JANUARY, 1923. No. 1.

GENERAL SUMMARY.

January, 1923, was a decidedly mild month in all of Missouri. The marked contrast of temperatures in successive Januarys is shown in table in the lower right-hand corner of this page. In recent years 1918 and 1920 were cold, 1919 mild, and 1921 and 1923 very mild. The last seems to have been the mildest of record, covering 36 Januarys. One feature of January, 1923, stands out prominently, and that is the absence of zero temperatures, 3° above zero being the minimum recorded. Of the 36 Januarys, shown in the table, 21 have quite marked plus departures from the normal. One should not, however, jump to any conclusion from a study of the monthly means alone. A casual glance down the column headed "Lowest" will show that there were some cold days during many of those otherwise mild Januarys.

Nearly the whole month, except the latter half in the southeastern section where it was frequently rainy, was favorable for outdoor pursuits. The public highways were in fine condition most of the time. A large amount of business was done in building materials; but the demand for fuel was somewhat less than normal, as also was the demand for transit feeds.

Winter wheat made good root growth and kept a healthy color. Live stock did well in the open on stalk fields and hay stacks. Considerable plowing was done, and a few farmers finished that work for the spring.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 69 stations, was 39.2°, or 8.5° above the normal as determined from 66 stations having records of 10 years or more. It is the warmest January of record, beginning with 1888; even warmer than the same month in 1921, the record breaker up to that time. The mildness was uniformly distributed and marked in all sections. There was only one cold spell, 3rd to the 6th. There were only two winter days, 6th and 23rd. From the 7th to the 21st the daily excess ranged from 8° to 21°, or an average of about 14°; and from the 24th to the 31st the excess in warmth was even more marked. There were no zero temperatures, and in this respect, also, the month seems to stand alone.

PRECIPITATION.

The average for the State, 86 stations reporting, was 2.72 inches. The departure from the normal for 74 stations having 10 or more years' record was plus 1.81 inches. The precipitation was unevenly distributed, the southwestern plain and most of the northern half of the State being unusually dry, while the greater part of the Ozarks and all of the southeastern lowlands were markedly wet. In the northwestern plateau and a considerable part of the northeastern plain the total precipitation was barely appreciable; along the southern slope of the Ozark Plateau eastward to the Mississippi River amounts ranged from 5 to more than 7 inches. There was very little rain during the first 11 days, and it was scanty the last 15 days in most sections north of the Ozarks.

Snow fell in sections north of the Missouri River on the 4th, and 7th, covering the ground to appreciable depths, but it melted quickly. South of the Missouri River there was some local sleet or glaze.

WIND.

The prevailing winds were from the northwest, though much of the time they were southerly. The total movement, 8 stations equipped with anemometers reporting, was 7,751 miles, an average hourly velocity of 10.4 miles. There were no strong winds, save perhaps on the 7th, and 8th, when velocities ranged between 36 and 44 miles.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 149, or 49 per cent of the possible, and about 2 per cent below normal. The sunshine this month was 9 per cent less than the same month last year.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---On the 7th, 25th, 27th, and 31st.
Hail.---At Gano on the 14th, and St. Catharine on the 16th.
Halos, solar.---9th, 11th, 17th, 21st, 22nd, 25th, 28th, and 29th.
Halos, lunar.---1st, 3rd, 5th, 11th, 21st, 23rd, 25th, 28th, and 29th.
Sleet or Glaze.---6th, 7th, 23rd, and 26th.
Thunderstorms.---13th, 14th, and 26th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for January, 1923.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., FEBRUARY, 1923. No. 2.

GENERAL SUMMARY.

February, 1923, in Missouri, was open and mild, the same as the preceding days of January. Beginning with the 3rd, or 4th and continuing up to or near the 20th unusually well formed high pressure waves dominated the weather most of the time, and as a result there were some cold days, about 12 or 13 averaging below normal, and about eight being typical winter days. The last week was spring like. Except in parts of the southeastern section precipitation was scanty; and, it might be pointed out, this month makes the eighth consecutive dry February, and, also, the first since 1917 with below normal temperature.

Save a few disagreeable days, the month was favorable for outdoor occupations, particularly from about the 14th to the 23rd, when house building, road construction, and plowing were continuous. The cold snap brought about livelier trade in clothing and food lines, but on the other hand the number of influenza cases increased markedly.

Winter wheat in a few localities, on thin soil, was off-color after the coldest snap, but the condition and progress of the crop in general was satisfactory. Live stock was out on hay stacks and stalk fields most of the time.

TEMPERATURE.

The monthly mean temperature, 69 stations reporting, was 30.2°. The mean departure from the normal for 67 stations having 10 or more years' record was minus 1.2°. This February is the first since 1917 with temperature nearly normal or below. The weather of the month was variable, mild and cold spells of a few days duration following each other quickly. In a general way the coldest days were 3rd, 4th, 9th, 10th, 11th, and 14th to 18th. Zero or near zero conditions prevailed on the 3rd, and 4th. The last week was spring-like in most of the State. There were 24 nights with temperature of 32° or lower; and on 8 days it did not exceed 32°. Zero to 9° below on two nights at stations in northern counties.

PRECIPITATION.

The monthly precipitation, based upon records of 86 stations, was 1.37 inches. The mean departure from the normal for 78 stations having 10 or more years' record was minus 0.88 inch. It is the 8th consecutive February with less than normal precipitation. Precipitation was frequent but light during the first 12 or 13 days, and from the 24th to the 28th. The greatest amounts, varying between 2 and 4 inches, fell in the southeastern lowlands and along the eastern Ozark slope, 50 per cent or more of the monthly totals falling on the 1st. and 2nd. No appreciable precipitation fell anywhere during the period from the 14th to the 23rd.

Snow mixed with sleet fell on the 12th generally. It remained on the ground one or two days. The total monthly snowfall ranged from 3 to 5 inches locally, but for the State as a whole it was 1.4 inches. The last four Februarys had light snows.

WIND.

The prevailing winds were from the northwest. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 6,875 miles, 10.2 miles an hour. Brisk to strong winds of 35 to 50 miles an hour occurred generally on the 13th. No damage was reported.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the records of 6 well placed stations equipped with sunshine recorders, was 167. This is about 56 per cent of the possible and about 3 per cent more than normal. There was about 7 per cent less sunshine than during the same month last year.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---10th, 11th, 12th, 13th, 24th, 26th, and 28th.
Halos, solar.---4th, 9th, 10th, 18th, 19th, 20th, and 21st.
Halos, lunar.---On the 27th.
Sleet.---1st, 2nd, 5th, 10th, 11th, 12th, and 24th.
Thunder heard on the 2nd, and 12th.

OBSERVERS' REMARKS.

Downing.---Very pleasant February. The cold weather of the first half of the month made ice thick enough to harvest. Rain is needed to fill cisterns.

St. Catharine.---A pleasant month; fine for outdoor work. Live stock did well on stalk fields. High winds on 17th.

Warrenton.---Barometer registered 30 inches on 15th, highest reading in years. Fine weather prevailed.

Farmington.---A cold month, but not unpleasant winter weather.

Gano.---The coldest month of the winter. Wheat does not look good. Peach buds safe yet.

Lebanon.---Snow on ground from 6th to 11th. Pleasant winter month.

Lockwood.---Fine open month, with ample moisture. Some oats sown. Wheat looks fine. Live stock in good condition.

Rolla.---Fine weather; unusually dry for February.

Appleton City.---First snow of winter on 3rd. Considerable plowing done. Roads dusty part of time. Wheat needs moisture.

Harrisonville.---First snow of the season fell on the 11th.

Lamonte.---Unusually open February in this locality. Wheat looks good.

Nevada.---Light snow on the 6th, the first of the winter. Fine weather prevailed.

Warsaw.---Dry but fine month. Only two snows of 2 inches each during this winter.

Avalon.---Very dry month. Fine on live stock. Ground in fine condition for spring plowing.

Bethany.---The cold of the 3rd and 4th did very little damage. Unusually fine weather has prevailed. Roads in good shape.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for February, 1923.
